### MINE HEALTH AND SAFETY ACT, 1996 (ACT NO 29 OF 1996)

# GUIDELINE FOR THE COMPILATION OF A MANDATORY CODE OF PRACTICE FOR AN OCCUPATIONAL HEALTH PROGRAMME (OCCUPATIONAL HYGIENE AND MEDICAL SURVEILLANCE) ON PERSONAL EXPOSURE TO AIRBORNE POLLUTANTS

I, MTHOKOZISI ZONDI, Chief Inspector of Mines, under section 49 (6) of the Mine Health and Safety Act, 1996 (Act No. 29 of 1996) and after consultation with the Council, hereby issues the guideline for the compilation of a mandatory code of practice for an occupational health program (occupational hygiene and medical surveillance) on personal exposure to airborne pollutants in terms of the Mine Health and Safety Act, as set out in the Schedule.

MTHOKOZISI ZONDI CHIEF INSPECTOR OF MINES ACTING

SCHEDULE

UNUDER TRUBAL PRACTIC PROCESSION OF PERSONNEL FARMARIE CONTRACTORS AND COMPACT AND CONTRACTORS

### PART A: THE GUIDELINE

### 1. FOREWORD

- 1.1. The Commission of Inquiry into Safety and Health in the mining industry, chaired by the Honourable Mr. Justice R N Leon, identified occupational health as one of the four major issues affecting occupational health and safety in the mining industry.
- 1.2. To address this issue, a tripartite sub-committee was established under the auspices of the Mining Occupational Health Advisory Committee (MOHAC). MOHAC found it necessary to address this issue a guideline for a mandatory code of practice (COP) for airborne pollutants be drafted.
- 1.3. Significant risks to health exist in mining. To protect, monitor and promote employees' health status, an occupational health program is required where exposure to such significant risks occur. MOHAC considered it appropriate to prepare a guideline covering both occupational hygiene and medical surveillance to ensure compliance and uniform standards.
- 1.4. Where the employer's risk assessment indicates a need to establish and maintain either a system of occupational hygiene measurements or a system of medical surveillance, or where either such system is required by regulation, the employer must prepare and implement a COP based on this guideline.
- 1.5. This guideline assists employers with the establishment of an occupational health programme, but does not stipulate specific requirements for specific circumstances. It sets out a basic system for managing risks to health. The first component of any management system is finding out what the situation is and the second is deciding what to do about it.
- 1.6. This guideline replaces the "Guideline for the compilation of a mandatory COP for an occupational health programme on personal exposure to airborne pollutants with reference number DME 16/3/2/4-A1" published by the Department of Mineral Resources (DMR) in 2002.

No. 41561 51

OCCUPATIONAL REALTOPTOORALING, OW YET ONNE EXPLOSIVE RECEASE PLOTOALING

## 2. LEGAL STATUS OF THE GUIDELINE AND CODES OF PRACTICE

2.1 In accordance with Section 9(2) of the Mine Health and Safety Act, 1996 (Act 29 of 1996), as amended (MHSA), an employer must prepare and implement a COP on any matter affecting the health and safety of employees and other persons who may be directly affected by activities at the mine, if the CIOM requires it. These COPs must comply with any relevant guidelines issued by the CIOM [Section 9(3) MHSA]. Failure by the employer to prepare or implement a COP in compliance with this guideline is a breach of the MHSA.

### 3. OBJECTIVES OF THE GUIDELINE

- 3.1 The objective of this guideline is to enable the employer at every mine to compile a COP, which, if properly implemented and complied with, would protect and improve the health of employees at the mine, by monitoring and reducing their exposure to airborne pollutants.
- 3.2 This guideline provides guidance of a general nature on the required format and content for the COP and details sufficient technical background to enable the drafting committee at the mine to prepare a comprehensive and practical COP for the mine. It sets out the two components of an occupational health programme namely:
- 3.2.1 Occupational hygiene; and
- 3.2.2 Medical surveillance.
- 3.3. Where an employer is required, in terms of Regulation 9.2(2) or in terms of its risk assessment, to establish and maintain a system of occupational hygiene measurements in respect of airborne pollutants, this guideline should assist the employer in doing so.

#### GOVERNMENT GAZETTE, 6 APRIL 2018

HOPURATIONAL REALTH FROM AMME OF PERSONAL OF POSSIDE TO A SECTOR EVEN AND A DESTRUCTION OF

### 4. DEFINITIONS AND ACRONYMS

In this guideline for a COP, unless the context otherwise indicates:

"Airborne pollutant" means any substance in the air that is harmful to health, including dust, fumes, aerosols, gases, fibres, vapours or mists.

"Analysis methodology" means analysis techniques used to quantify a pollutant collected on or in sampling media (e.g. gas chromatography/mass spectrometry).

"CIOM" means Chief Inspector of Mines.

"COP" means code of practice.

"DMR" means the Department of Mineral Resources.

"Exposure" means the subjection of a person to an airborne pollutant during employment through any route of entry (e.g. inhalation, ingestion, skin contact or absorption).

"Homogeneous exposure group (HEG)" means a group of employees whose exposures to a hazardous agent have been determined to be statistically similar enough that, by monitoring a small number of individuals in the group, the exposures of the remaining workers can be defined.

"MOHAC" means Mining Occupational Health Advisory Committee.

"Monitoring" means the repetitive and continued observation, measurement and evaluation of health and/or environmental, or technical data according to pre-arranged schedules, using nationally or internationally acceptable methodologies.

"MHSA" means the Mine Health and Safety Act, 1996 (Act 29 of 1996) as amended.

"NIOSH" means the United States National Institute for Occupational Safety and Health.

I LEURATORAL MEALTO TTA ORAMME CONDUCTIONALEZZO SURE TO ARROND INTELLOZOTICE

"Qualitative" means observations or information characterised by measurement on a categorical scale (i.e. dichotomous or nominal scale) or, if the categories are ordered, an ordinal scale e.g. "low", "medium", "high".

"Quantitative" means data in numerical quantities such as continuous measurements or counts e.g. percentile or rates.

"Occupational exposure limit (OEL)" means the TWA concentration for an 8-hour work day and a 40-hour work week to which nearly all workers may be repeatedly exposed to without adverse health effects.

"Sampling cycle" means the planned sampling program for the year, which must terminate at the end of each calendar year.

"TWA" means time weighted average.

"90<sup>th</sup> percentile" means the statistical value of exposure data which must be used to determine when HEGs need to be re-classified, calculated either by:

- Using Microsoft Excel programme (percentile function); or
- First placing all sample results in order from the lowest concentration to the highest concentration (i.e. concentration of specific contaminants). Next, assign each sample result a number, starting with the number one for the lowest concentration result up to the highest concentration being given the number equal to the total number of samples collected in that HEG. Multiply the total number of samples collected by 0.9. The sample result with the number corresponding to this calculated value is the 90<sup>th</sup> percentile.

#### 5. SCOPE

5.1 Regulation 9.2(2) requires that a system of occupational hygiene measurements on personal exposure to airborne pollutants must be prepared and implemented when the results of the risk assessment conducted has identified that the following hazard limits prevail:

#### GOVERNMENT GAZETTE, 6 APRIL 2018

THE OF A DEMANDER OF ALLER FEELWARKER LIN PERSONAL CARLSUNG TO ADDRESS IN TO OTHER LINES.

- 5.1.1 Particulates  $\geq 1/10$  (10%) of the OEL.
- 5.1.2 Gasses ≥ 1/2 (50%) of the OEL.
- 5.2 Where there is no statutory determined OEL for a particular airborne pollutant the risk assessment conducted should determine how the pollutant must be addressed in the COP.
- 5.3 This guideline is aimed at assisting employers to draft a COP for an occupational health programme which measures occupational exposures to airborne pollutants aimed at ensuring compliance with OELs, protecting worker health and linking these exposure results to employee medical records.

### PART B: AUTHOR'S GUIDE

- The COP must, where possible, follow the sequence laid out in Part C: Format and content of the COP. The pages as well as the chapters and sections, must be numbered, where possible, to facilitate cross-referencing. Wording must be unambiguous and concise.
- 2. It should be indicated in the COP and on each annexure to the COP whether:
- 2.1 The annexure forms part of the COP and must be complied with or incorporated in the COP or whether aspects thereof must be complied with or incorporated in the COP; or
- 2.2 The annexure is merely attached as information for consideration in the preparation of the COP (i.e. compliance is discretionary).
- When annexures are used, the numbering should be preceded by the letter allocated to that particular annexure and the numbering should start at one again. (e.g. 1, 2, 3 and A1, A2, A3).
- Whenever possible illustrations, tables, graphs and the like, should be used to avoid long descriptions and/or explanations.
- When reference has been made in the text to publications or reports, references to these sources must be included in the text as footnotes or side notes as well as in a separate bibliography.

#### GOVERNMENT GAZETTE, 6 APRIL 2018

LELUPATIONAL NEAL INTRACTORIAN CONTROLOGICAL CONTROLOGICAL DOCUMENTS

## PART C: FORMAT AND CONTENT OF THE MANDATORY COP

1. TITLE PAGE

The COP should have a title page reflecting at least the following:

- 1.1 The name of the mine;
- 1.2 The heading: "Mandatory Code of Practice for the Assessment of Personal Exposure to Airborne Pollutants";
- A statement to the effect that the COP was drawn up in accordance with guideline DMR 16/3/2/4-A1 issued by the CIOM;
- 1.4 The mine reference number for the COP:
- 1.5 The effective date;
- 1.6 The revision dates (if applicable); and
- 1.7 The DMR mine code number.
- 2. TABLE OF CONTENTS

The COP must have a comprehensive table of contents.

### 3. STATUS OF THE MANDATORY CODE OF PRACTICE

This section must contain statements to the effect that:

- 3.1 The COP was drawn up in accordance with guideline DMR 16/3/2/4-A1 issued by the CIOM;
- 3.2 This is a mandatory COP in terms of Section 9(2) and 9(3) of the MHSA;

No. 41561 57

CONTRACTORY DEPENDENT OF AN ANTAL CONTRACTOR OF A DESCRIPTION OF A DESCRIP

- 3.3 The COP may be used in an accident investigation/inquiry to ascertain compliance and to establish whether the COP is effective and fit for purpose;
- 3.4 The COP supersedes all previous relevant COPs; and
- 3.5 All managerial instructions, recommended procedures (voluntary COPs) and standards on the relevant topics must comply with the COP and must be reviewed to ensure compliance.

## 4. MEMBERS OF THE DRAFTING COMMITTEE

- 4.1 In terms of Section 9(4) of the MHSA the employer must consult with the health and safety committee on the preparation, implementation or revision of any COP.
- 4.2 It is recommended that the employer should, after consultation with the employees in terms of the MHSA, appoint a committee responsible for the drafting of the COP.
- 4.3 The members of the drafting committee assisting the employer in drafting the COP, should be listed giving their full names, designations, affiliations and experience. This committee must include competent persons sufficient in number to effectively draft the COP.

### 5. GENERAL INFORMATION

General relevant information relating to the mine must be stated in this section of the COP, which must include at least the following:

- 5.1 A brief description of the mine and its location;
- 5.2 The commodities produced;
- 5.3 The mining method or combination of methods used at the mine must be listed. This section must discuss the degree of mechanisation, taking care to identify the potential sources of pollutants and possible pathways of exposure, and possible exposure scenarios;

#### GOVERNMENT GAZETTE, 6 APRIL 2018

TE A ROTTORAL HEALTHY FRENKAMMENTER FOR A MALEADOURT TO A BRANCE POINT OF

- 5.4 The general controls in place to prevent exposure to airborne pollutants including ventilation arrangements;
- 5.5 Other related COPs and management standards must be reviewed concurrently to avoid conflict of requirements as laid down by the employer. The objective would be to have an integrated system; and
- 5.6 The unique features of the mine that have a bearing on this COP and cross-reference them to the risk assessment conducted.

### 6. TERMS AND DEFINITIONS

Any word, phrase or term of which the meaning is not absolutely clear, or which will have a specific meaning assigned to it in the COP, must be clearly defined. Existing and/or known definitions should be used as far as possible. The drafting committee should avoid jargon and abbreviations that are not in common use or that have not been defined. The definitions section should also include acronyms and technical terms used.

### 7. RISK MANAGEMENT

- 7.1 Section 11 of the MHSA requires the employer to identify hazards, assess the health and safety risks to which employees may be exposed while they are at work, record the significant hazards identified and risks assessed. The employer must determine how the significant risks identified in the risk assessment process must be dealt with, having regard to the requirement of Section 11(2) and 11(3) that, as far as reasonably practicable, attempts should first be made to eliminate the risk, thereafter to control the risk at source, thereafter to minimise the risk and thereafter, insofar as the risk remains, to provide personal protective equipment and to institute a programme to monitor the risk.
- 7.2 To assist the employer with the risk assessment with all possible relevant information such as accident statistics, ergonomic studies, research reports, manufacturers specifications, approvals, design and performance criteria for all relevant equipment should be obtained and considered.

OCCURATIONAL NEIGHT AND SKARAFE ON PERSONAL EXPOSURE SEARCORD, POLLUTANTS

7.3 In addition to the periodic review required by Section 11(4) of the MHSA, the COP should be reviewed and updated after every serious incident relating to the topic covered in the COP, or if significant changes are introduced to procedures, mining and ventilation layouts, mining methods, plant or equipment and material.

### 8. KEY ELEMENTS TO BE ADDRESSED IN THE COP

- 8.1 Where the employer's risk assessment indicates a need to establish and maintain a system of occupational hygiene measurements and a system of medical surveillance, or where such systems are required by regulations, the following key elements must be addressed in the COP:
  - Risk assessment and control.
  - Personal exposure monitoring.
  - Hierarchy of controls.
  - Medical surveillance.
  - Reporting and reviewing.

These key elements are shown in Figure 1 below.

The occupational health programme to be implemented on the mine should be summarised in the COP in a flow chart similar to Figure 1.

#### 8.2 Components of an occupational health programme

The occupational health programme has two components namely:

- 8.2.1 Occupational hygiene; and
- 8.2.2 Medical surveillance.

Reproduced by Sabinet Online in terms of Government Printer's Copyright Authority No. 10505 dated 02 February 1998

GOVERNMENT GAZETTE, 6 APRIL 2018

OCCUPATIONAL MEALTH PROGRAMME ON FERSION OF INCENDE TO MIDROPHE FOLL/ITTATION

### 8.3 Occupational hygiene programme

In order to prepare the occupational hygiene programme for the mine, the COP should cover the following steps:

- Step 1: Risk assessment.
- Step 2: Determination of HEG.
- Step 3: Sampling and analysis methodology and quality control.
- Step 4: Personal exposure monitoring.
- Step 5: Linking of occupational exposure.
- Step 6: Hierarchy of control measures.
- Step 7: Reporting and recording.

### 8.3.1 Risk assessment

The COP should set out measures to ensure that a qualitative and quantitative risk assessment process is followed and takes into account all the factors influencing the health of employees.

NOTE: Chapter 3 of the handbook published by the Safety in Mines Research Advisory Committee (SIMRAC): "Handbook on Occupational Health Practice in the South African Mining Industry" could be consulted to assist in conducting a risk assessment.

The COP should address the following points:

#### 8.3.1.1 Baseline risk assessment

At the initial commencement of a system of occupational hygiene measurements, as contemplated in Section 12(2) of the MHSA, a baseline risk assessment is to be conducted to assess exposure to airborne pollutants.

<b>52</b> No. 4156 <sup>-</sup>	GOVERNMENT GAZETTE, 6 APRIL 2018
	DUCUPATIONAL REALTH FROSKMMME ON PERSONAL EXPOSORE TO AIRDORNE POLLUTARTS
8.3.1.2	The risk assessment must be described with reference to:
	<ul> <li>Any airborne pollutant(s) to which employees are being exposed to (refer to Chapter 22 of the MHSA airborne pollutants occupational exposure limits);</li> </ul>
	<li>b) The route of entry (where applicable e.g. inhalation, absorption, ingestion, etc. and health effects that these individual airborne pollutants can have or employees;</li>
	<li>c) Where such pollutants may be present, e.g. welding bay, spray painting booth battery charging stations, stope face, development end, etc.;</li>
	<ul> <li>d) The airborne nature of those pollutants identified, e.g. gases, fumes, vapou mists, fibres, dusts etc.;</li> </ul>
	<ul> <li>The nature of the key workplace operations and activities that pose the greates potential for exposure with identified airborne pollutants;</li> </ul>
	<ul> <li>f) The occupations and number of employees who are being exposed to airborn pollutants;</li> </ul>
	g) The pattern (e.g. intermittent, continuous, etc.), duration and frequency of employee exposure to the airborne pollutants identified;
	<ul> <li>h) The actual exposure levels measured compared to occupational exposur limits;</li> </ul>
	<ul> <li>The control measures in place, (e.g. substitution, engineering, administration personal protective equipment etc.), the additional control measures required t be instituted in order to reduce or maintain exposures to below the OELs, an if applicable, the planned programme of implementation;</li> </ul>
	<ul> <li>j) The frequency of any ongoing monitoring to assess the effectiveness of th controls mentioned above; and</li> </ul>

OLDUSATIONAL REALTH PROCRAMME DV PETECIMAL ENT OLDUE TO MERCUMI, PULLUI ANTS

- k) The relevant material safety data sheets as contemplated in Section 21(4)(a),
   (b) and (c) of the MHSA.
- NOTE: For the purpose of the risk assessment the commodity codes, activity codes, occupational codes and pollutant codes as set out in Annexure A should be used. Compliance with Annexure A is mandatory.

### 8.3.1.3 Review of risk assessment

The **COP** must address the review of the risk assessment whenever circumstances arise or change at the mine that could have an impact on the original assessments, and at least in the following instances:

- When outcomes of medical surveillance programs indicate the need for it;
- b) When a Section 11.5 investigation indicates the need for it;
- c) When new or revised legislation is introduced;
- d) When new mining methods are introduced;
- e) When process changes are introduced (e.g. in process plants); and
- f) When new types of machinery are introduced.

#### 8.3.1.4 Post risk assessment

The COP must address on an annual basis, the review of the risk assessment (continuous risk assessment and management) based on the personal **exposure monitoring** data of the previous cycle.

Historical data is to be maintained as provided for in Section 15(2)(a).

#### GOVERNMENT GAZETTE, 6 APRIL 2018

OCCUPATIONAL REACTH PROGRAMME ON PERSONAL EXPOSURE TO AIRPORNE FOLLUTANTE:

8.3.2 Determination of HEGs

The COP should address the following points:

8.3.2.1 HEGs should be identified for purposes of personal exposure monitoring. The baseline risk assessment will enable the identification of HEGs, which will be established as follows:

Step 1

The sub-division of the mine into sampling areas (e.g. surface = sampling area 1, underground section A = sampling area 2, underground section B = sampling area 3, underground section C = sampling area 4, etc).

NOTE: Surface operations proceed to step 3. Underground operations proceed to step 2.

Step 2

At underground mines, sampling areas should be sub-divided into ventilation districts which are areas of a mine, ventilated independently from other areas with a common dedicated intake and return airways. Any airborne contaminants released in a ventilation district will only affect that particular district and does not circulate through other areas of the mine where people may be exposed.

In order for an area to be classified as a ventilation district it must comply with:

- Ventilated independently from other areas.
- Independent intake and return airways.
- Does not contaminate other areas.

No. 41561 65

OCCUP//TICKAL HEACTH PROCRAMME ON PERSONAL EXPOSURE TO AVEBORING POLILUTANTS

Step 3

The sub-division of the sampling areas into activity areas as per the activity area code list found in Annexure A (mandatory codes). Annexure A must be complied with.

Step 4

To ensure that adequate measurements of personal exposures (refer also to paragraph 8.3.4 below) are taken in line with the identified **airborne pollutants** for each activity area. If insufficient historical personal exposure data is not available regarding the extent of the risk, a personal **monitoring** survey must be undertaken for each identified **airborne pollutant**.

NOTE: Acceptable methodologies on personal monitoring as stipulated by NIOSH should be used for this assessment.

Step 5

A statistical analysis should be conducted. Annexure B could be consulted in this regard. The results of the identified **airborne pollutants** present, either from historical data or from measured data, during the personal sampling strategy, in that particular activity area should be compared to their respective **OEL** values. These **OEL** values and pollutant codes are contained as Schedule 22.9(2)(a) in Chapter 22 of the **MHSA** regulations.

NOTE: Annexure B is attached for information purposes only.

Plot past data over time to determine whether the **exposure** trends are higher or lower. If the **exposure** trends exist, the Section 12(1) appointee should use only the most recent **exposure** data in the initial assessment.

In order to ensure that **HEGs** are correctly allocated a statistical analysis of the results is to be done. An example of such an approach is shown in Annexure B.

#### GOVERNMENT GAZETTE, 6 APRIL 2018

OCCUPATIONAL REALTH PROGRAMME ON PERSONAL EXPOSURE TO AIRBORNE POLLUTAWIS.

NOTE: Annexure B is attached for information purposes only.

Once the personal **exposures** within each activity area have been compared to their respective **OEL** values, each activity area can now be categorised into classification bands to determine the various **HEGs** within that activity area. The classification bands for **airborne pollutants** are tabled in Annexure C. Annexure C forms part of this guideline and must be complied with.

NOTE: An activity area e.g. stoping, is not a HEG. This activity area e.g. stoping, must be subdivided into the classification bands as shown above. These classification bands are the HEGs within that particular activity area.

Repeat step 4 for every pollutant identified in the risk assessment process.

#### Step 6

In this step were a single pollutant acting independently has been identified in an activity area the following process must be followed:

- a) Once the personal exposures within each activity area has been compared to the respective OEL values of the single pollutant, that activity area can now be categorised into classification bands determined by the various HEGs within that activity area. The classification bands for airborne pollutants are depicted in Annexure C. Annexure C is mandatory and must be complied with.
- b) If an employee is exposed to a number of identified pollutants, which have an additive effect, step 7 must be followed.
- c) Repeat step 5 for every such identified pollutant.
- NOTE: (1) Single pollutant where no additive effects are known or considered likely, the constituents can be regarded as acting 'independently'. It is then sufficient to ensure compliance with each of the individual OELs.

111

COMPATIONEL REALTH PROCRASSIE ON PERSONAL EXPOSURE TO AIRBORNE POLLOTANTS

(2) Refer to Annexure D with reference to identified pollutant acting independently.

NOTE: Annexure D is attached for information purposes only.

### Step 7

When pollutants that have an additive effect have been identified in an activity area where these effects are additive, their combined effects must be used when classifying the activity area into their respective **HEGs**. The following formula must be used to assess the combined effect.

- C<sub>1</sub>/L<sub>1</sub> + C<sub>2</sub>/L<sub>2</sub> + C<sub>3</sub>/L<sub>3</sub> .... for compliance, the combined effect should be < 1 where C<sub>1</sub>, C<sub>2</sub> etc. are the concentrations of constituents in air and L<sub>1</sub>, L<sub>2</sub> etc. are the corresponding OELs.
- NOTE: The OELs for pollutants listed in Schedule 22.9(2)(a) of the MHSA are for single compounds or for pollutants containing a common entity. Workers are however frequently subjected to mixed exposures. It is therefore necessary to take into account the possible additive or synergistic effects of these pollutants. Due to the difficulty in assessing, if the effects of a mixture of pollutants are either additive or synergistic, the requirements of this COP will be to treat all such cases as if they are additive. With all types of mixed exposures, it is essential that the classification band category assessment should be based on the concentrations of each of the constituents in air to which workers are exposed.

Table C1 in Annexure C depicts **exposures** to the various hazards that can be considered as being additive or synergistic. Annexure C is mandatory and must be complied with.

NOTE: Refer to Annexure D with reference to identified pollutants that have an additive effect. Annexure D is for information purposes only.

#### GOVERNMENT GAZETTE, 6 APRIL 2018

OCCOPATIONAL HEALTH PROGRAMME ON PERSONAL OPPOSIPE TO AIRPOINT DOLLUTANTS

8.3.2.2 At the end of each cycle (annually; end of calendar year) sampling results for each HEG must be statistically analysed and re-classified when required. Re-classification of HEGs should be done by means of statistically recognised principles. 90% confidence limits are to be used to test the homogeneity of HEGs. Refer to Annexure B for an example.

NOTE: Annexure B is attached for information purposes only.

The total number of exposed employees will be determined at the beginning of annual reporting cycle and would only change if there is an increase in employees during the quarterly reporting cycle (exposed individuals are only counted once in an annual reporting cycle to prevent duplicate counting).

Reduction in employees would not reduce the total number of exposed employees during the reporting cycle.

- NOTE: The total number of exposed employees will be determined at the start of annual sampling cycle based on the previous year's results in accordance with the HEG classification based on the various exposure bands.
- 8.3.2.3 **HEGs** must be re-assessed whenever circumstances arise or change at the mine when the following occurs:
  - Exposure levels change due to controls being initiated and likewise, when controls deteriorate.
  - b) Employee complaints are received.
  - Processes are changed (e.g. change in procedures, mining and ventilation layouts, mining methods, plant, equipment or material).
  - d) Occupational illness occurs.
  - e) A change in exposure category occurs.

No. 41561 69

- f) Other events warranting re-evaluation occurs:
  - (i) New technological data; and
  - (ii) New regulatory initiatives.
- g) Should the review of the baseline assessment warrants it.
- 8.3.3 Sampling, analysis methodology and quality control

The COP must address the following points:

8.3.3.1 Continuing sampling strategy

Continuing sampling must be conducted to assess whether significant changes in trends have occurred and should be added to accumulated data during statistical analysis re-classification of HEGs.

a) Determining sample size

The total number of samples should be evenly spread out over a twelve-month period for all categories, that is A, B and C, as below.

A minimum of 5% or five samples (whichever is the greater) per **HEG** should be taken as per classification bands in Annexure C as per the following:

- i. Category A 5% or five samples per quarter;
- Category B 5% or five samples six-monthly to be evenly spread biannually;
- Category C 5% or five samples per annum to be evenly spread annually; and

#### GOVERNMENT GAZETTE, 6 APRIL 2018

OCCUPATIONAL REALTH PROORAMME ON PERSONAL EXPOSURE TO AIRFORME POLIUTANTS.

- iv. Category D no sampling plan for this category. Measurement results that are below 10% of the OEL will be reported under this category.
- NOTE: Annexure C is mandatory and must be complied with.
- b) Section 12(1) appointees must use their professional judgment to decide whether additional samples need to be taken in order to increase the confidence that HEGs are appropriately categorised.
- 8.3.3.2 Sampling strategy and schedules

The COP should address a sampling strategy that includes a monitoring schedule for each HEG. The sampling cycle and records thereof should be kept as required by law (see for example Sections 12(3) and 15(2)(b) of the MHSA).

- 8.3.3.3 Sampling methodology
  - a) The COP should address, for each pollutant identified, an appropriate sampling methodology selected and implemented (refer to Annexure E: Background information on particulates; sampling and analysis methodology. Annexure E is for information purposes only).
  - b) The COP should put measures in place to ensure that a quality control program for the sampling methodology is developed and implemented.
    - NOTE: (1) Refer to Annexure F: Quality assurance. Annexure F is for information purposes only.
       (2) The relevant methodology chosen for each pollutant identified must be stated in the COP.

No. 41561 71

OPCOPATIONAL REALTH PROGRAMME ON PERSONAL EXPOSIBLE TO MREAPLE POLYTEMESTER

8.3.3.4 Chemical analysis methodology

The COP should address the following points:

- a) For each pollutant identified, an appropriate chemical analysis methodology, which complies with internationally accepted good practice, should be selected and implemented. All the selected chemical analytical methods should be listed in the COP e.g. NIOSH methods for silica crystalline respirable: NIOSH 7500 (XRD); NIOSH 7602 (IR).
- b) The sample analysis should be done either by a laboratory that is accredited (accredited to chemically analyse the specific pollutants) in terms of South African bureau of Standards (SABS) ISO/IEC 17025 of the South African National Accreditation System (SANAS), or a laboratory that is participating in a proficiency testing program and is in a process of obtaining SANAS accreditation, which latter laboratory must produce a proficiency test certificate to the client before doing any sample analysis.
- c) A minimum number of samples taken as determined in accordance with 8.3.3.1(a) of this guideline must each be individually analysed.
- NOTE: The results from the analysis obtained in a HEG will be averaged and allocated to the specific HEG in which the samples were taken.

#### 8.3.3.5 Gravimetric weighing facilities

The **COP** should contain measures to ensure that gravimetric weighing facilities have a quality control program in place (refer to Annexure E for information on the requirements for a weighing facility and to Annexure F for a quality control program. Annexures E and F are for information purposes only).

#### GOVERNMENT GAZETTE, 6 APRIL 2018

OCCUPATIONAL VEALIN PROGRAMME ON PERSON & EXPOSURE TO AIPEORNE POLLUTIONT

### 8.3.4 Personal exposure monitoring

The **COP** should set out measures to ensure that personal **exposure monitoring** is conducted to obtain reliable estimates of employee shift **exposures** in a workplace. Samples taken should be:

- a) Representative of all full working shifts;
- b) Measured and compared to occupational exposure limits per working shift e.g. day shift and night shift;
- c) Randomly spread over the full sampling cycle period for each HEG; and
- d) Randomly spread across all occupations within the HEG.

# 8.3.4.1 Training

The COP should set out the training programme in place for:

- a) Storage and maintenance of equipment;
- b) Issuing of the sampling equipment;
  - c) Wearer of the sampling equipment;
  - d) Handling of the sampling equipment;
- e) Transportation of equipment; and
- f) Pre- and post-calibration of the sampling train checks.

K

No. 41561 73

OCCUPATIONAL NEALTH PADGRAPHENT IN FERSION EXERCISIES IN TRADICIDE STATISTICS

#### 8.3.5 Hierarchy of control

The **COP** should address the hierarchy of controls which are going to be implemented to mitigate the risk(s). The following hierarchy of controls should be taken into consideration:

- Elimination;
- Engineering controls;
- Administrative controls;
- Minimising (the risk); and
- Personal protective equipment.
- 8.3.6 Recording and reporting

The COP should address the following:

8.3.6.1 Record keeping system

A record keeping system, which records the **exposure** history of each **HEG** at the mine, should be kept and be readily available at the mine, including any reasons for deviation on sample results such as:

- a) Controls not operating effectively; and
- Events or factors which have influenced the results, e.g. air sampling at surface operations after high rainfall or during excessive winds.

### 8.3.6.2 Mandatory reports

Reporting to the **DMR** must be done on a quarterly basis for all categories, that is A, B, C and D (refer to Annexure C: Classification bands and reporting forms. Annexure C is mandatory and must be complied with).

NOTE: (1) For all categories A, B and C, the measurement results on the samples taken at that time must be reported at the end of each quarter.

74 No. 41561

#### GOVERNMENT GAZETTE, 6 APRIL 2018

DC CURATIONAL REALTH PROGRAMME ON PERSONAL EXPOSURE TO AIRPORTE POLLUTANTS

The rolling average results must be reported at the end of each sampling cycle.

(2) The results in a HEG of which 90<sup>th</sup> percentile equates to less than 10% of the OEL will be classified under D category.

(3) Pollutant(s) that do not have an additive effect on the target organ(s) must be separately reported.

- 8.4 Occupational medical surveillance
- 8.4.1 Occupational medical surveillance programme

The COP should describe:

- 8.4.1.1 The medical surveillance program at the mine as required in terms of Section 13 and Regulations 11.5, 11.6 and 11.7 of the MHSA and any additional medical surveillance required in terms of the employer's risk assessment.
- 8.4.1.2 The method used to link the occupational hygiene measurements (e.g. exposures to individual pollutants as well as additive or synergistic mixtures) to each employee's record of medical surveillance as contemplated in Section 12(3) of the MHSA.
  - NOTE: A manual or computerised system could be utilised to link this information. This system may have to be customised in accordance with the employer's specific needs or commercial programs. Effective communication between the Section 12(1) appointee and the occupational medical practitioner is recommended to ensure that the linkages between occupational hygiene **exposures'** history and medical conditions are identified.
- 8.4.1.3 The procedure on how the following categories of medical surveillance in terms of the MHSA, will be conducted:
  - (a) Initial examination in terms of Section 13(2)(c);
  - (b) Periodic examination in terms of Section 13(2)(c); and

DCCUENTICINAL VIEW, THE PROGRAMME ON RERSONAL OXIVITY ON TO MORDRINE POLITICANT

- (c) Exit examination in terms of Sections 17 and 19(2).
- 8.4.2 Methodological standards for test techniques forming part of medical surveillance
- 8.4.2.1 The COP should set out measures to ensure that chest x-rays:
  - (a) Are at least 35x43cm in size, even when digital;
  - (b) Are of a suitable quality for proper identification and classification of pneumoconiosis; and
  - (c) Show the date, name of individual and any unique form of personal identification used by the mine (e.g. identity number, personnel number, passport number, company number, etc.).
- 8.4.2.2 The COP must set out how lung function testing will be conducted.
  - NOTE: The occupational medical practitioners Guidance Note for Lung Function Testing (DMR 25/5/P) and the Guidance Note for Occupational Medical Practitioners: Tuberculosis Control Programs (DMR 25/5/P) could be consulted.
- 8.4.3 Inclusive medical surveillance system
- 8.4.3.1 The COP should set out measures to ensure that the system of medical surveillance is designed in consultation with the occupational medical practitioner to avoid duplication where employees are exposed to more than one hazard. A single, similar test could suffice for the medical surveillance of more than one hazard. It could therefore be possible to use the same examination or test for the medical surveillance of more than one hazard, provided that the requirements of medical surveillance for each hazard are achieved.

#### GOVERNMENT GAZETTE, 6 APRIL 2018

DECURATIONAL REALTH PROGRAMME ON PERSONAL EXPOSURE TO MABDRINE FOLL (ITAMTS

### PART D: IMPLEMENTATION

#### 1. IMPLEMENTATION PLAN

- 1.1. The employer must prepare an implementation plan for its COP that makes provision for issues such as organisational structures, responsibilities of functionaries and programmes and schedules for the COP, that will enable proper implementation of the COP (a summary of and a reference to, a comprehensive implementation plan may be included).
- 1.2. Information may be graphically represented to facilitate easy interpretation of the data and to highlight trends for the purposes of risk assessment.

# 2. COMPLIANACE WITH THE CODE OF PRACTICE

The employer must institute measures for **monitoring** and ensuring compliance with the **COP**.

# 3. ACCESS TO THE CODE OF PRACTICE AND RELATED DOCUMENTS

- 3.1 The employer must ensure that a complete COP and related documents are kept readily available at the mine for examination by any affected person.
- 3.2 A registered trade union with members at the mine or where there is no such union, a health and safety representative on the mine, or, if there is no health and safety representative, an employee representing the employees on the mine, must be provided with a copy on written request to the manager. A register must be kept of such persons or institutions with copies to facilitate updating of such copies.
- 3.3 The employer must ensure that all employees are fully conversant with those sections of the COP relevant to their respective areas of responsibilities.

#### GOVERNMENT GAZETTE, 6 APRIL 2018

ANNEXURE B: HEG determination, example of statistical approach

(This annexure is attached for information purposes only)

Introductory information:

<sup>1</sup>In statistics, a **confidence interval** is a particular kind of interval estimate of a population parameter. Instead of estimating the parameter by a single value, an interval likely to include the parameter is given. Thus, confidence intervals are used to indicate the reliability of an estimate. How likely the interval is to contain the parameter is determined by the **confidence level** or confidence coefficient. Increasing the desired confidence level will widen the confidence interval.

A confidence interval is always qualified by a particular confidence level, usually expressed as a percentage. The end points of the confidence interval are referred to as confidence limits.

Step 1

Action to be performed:

- 1. Capture sampling data in Microsoft Excel.
- Determine the descriptive statistics for the data by utilising Microsoft Excel Analysis ToolPak.

To install the Analysis ToolPak:

- On the Tools menu, select Add-Ins.
- If Analysis ToolPak is not listed in the Add-Ins dialog box, click Browse and locate the drive, folder name and file name for the Analysis ToolPak Add-Ins, Analys32.xll usually located in the Library/Analysis folder, or run the Setup program if it is not installed.
- Select the Analysis ToolPak check box.

1. Interval estimation [online] available from https://en.wikipedia.org/wiki/Interval\_estimation

No. 41561 111

OF CUPATIONAL REALTH PROGRAMME ON PERSONAL EXPOSIBLE TO AMOUNTS FOLLUTANT

To use the Analysis ToolPak:

- Before using the Analysis ToolPak, you must first arrange the data you want to analyse in one column (e.g. A1 to A40 – if you have 40 values that you want to analyse).
- On the Tools menu, click Data Analysis.
- In the Analysis Tools box, select the Descriptive Statistics tool.
- Enter the input range (e.g. A1 to A40).
- Select the Grouped by Columns option.
- Select the output range (e.g. B1 to B40).
- Select the Summary Statistics option.
- Select the Confidence Level of Mean option and enter this value as being 95%.
- Select OK.

Expected result:

Example of data entered into Microsoft Excel	Expected result after completing actions as indicated under STEP 1 DESCRIPTIVE STATISTICS			
DATA				
1.78	Mean	1.963		
1.87	Standard error	0.148		
2.15	Median	2.150		
2.29	Mode	#N/A		
2.54	Standard deviation	0.535		
1.51	Sample variance	0.286		
2.47	Kurtosis	-0.665		
2.45	Skewness	-0.689		
1.32	Range	1.65		
2.32	Minimum	0,89		
2.48	Maximum	2.54		
1.45	Sum	25.52		
0.89	Count	13		
	Confidence level (95.0%)	0.323		

112 No. 41561 GOVERNMENT GAZETTE, 6 APRIL 2018 CLEARAND ON THE ALTO PACE RADIAS OF PERSONAL EXPOSURE TO LIFE OF POLICY AND AND Step 2 Action to be performed: From the descriptive statistics calculate the following: A) 2SD = 2 x Standard Deviation  $2 \times 0.535 = 1.071$ e.g. Mean - 2SD = Mean - 2SD B) e.g. 1.963 - 1.071 = 0.892Mean + 2SD C) = Mean + 2SD 1.963 + 1.071 = 3.034e.g. D) 90<sup>th</sup> Percentile value by utilizing the following Microsoft Excel formulae: = PERCENTILE (A1:A40,0.9) = 2.478 (for the data used in this example) where: "A1:A40" = Range were data is entered in Microsoft Excel spread sheet "0.9" = The percentile to be calculated, in this case the 90th percentile Interpretation:

From the calculation performed above it can already be estimated that this **HEG** in NOT statistically correct defined, as:

 The mean value falls within the "B Category" and the 90<sup>th</sup> percentile value falls within the "A Category". For a HEG to be statistically correctly defined its mean and 90<sup>th</sup> percentile values will almost always fall within the same classification band.

Step 3

Action to be performed:

Determine if 95% of the samples taken falls within two standard deviations (2SD) form the mean value.

OCCUPATIONAL REALTH PROGRAMME ON PERSONAL EXPOSURE TO AIRBORNE POLLUTANTS

Example:

- 95% of the samples must be between "Mean 2SD" (0.892) and "Mean + 2SD" (3.034)
- From the data 1 sample (0.89) is smaller than "Mean 2SD" and 0 samples are larger than "Mean + 2SD".

Interpretation:

One out of 13 samples represent 7.69 % of the sample group (e.g.  $1/13 \times 100 = 7.69$ %). This is more than the allowable 5% and therefore the **HEG** cannot be seen as statistically correctly defined.

Step 4

Action to be performed:

Draw a histogram to graphically indicate the data.

Expected result:

### GOVERNMENT GAZETTE, 6 APRIL 2018

COCCUPATIONAL CEALTH PRODRAMME (ALPERSONAL EXPOSURE TO AIREDNNE POLIUTANT

Interpretation:

From the histogram, it is also clear that the **HEG** is NOT statistically correctly defined (no bell curve). Only two things can be done to correct this situation:

- Obtain more samples to determine the correct distribution of samples within the HEG. This is currently being forced by the legislated sampling strategy as the "mean" value reported for dose (concentration of airborne pollutant(s) to which a person is exposed) allocations, (for an OEL of two in this example) falls within a "B Category" (5% sampled over six months) but the 90th percentile value is reported as an "A Category" thus forcing more samples to be taken (5% over three MTh's).
- Conduct an investigation to determine if more than one HEG is being represented by the data.

Step 5

Action to be performed:

Conduct an investigation to determine if more than one **HEG** is being represented by the data. This can be done by investigation and following the methodology as explained, up to this point (for example):

After investigation, the HEG was divided into two separate HEGs (intake-side HEG and return-side HEG).

No. 41561 115

DOCUPATIONAL HEALTH PROGRAMME UNLIGHTSOMMERSPONDE TO AMBORINE POLIUTANTC

The data collected was then allocated to the two **HEGs** and the statistical analysis revealed the following:

DATA ALLOCATED TO THE INTAKE SIDE HEG	DESCRIPTIVE STAT	DESCRIPTIVE STATISTICS		
0.89	Mean	1.47		
1.32	Standard error	0.14		
1.78	Median	1.48		
1.87	Mode	#N/A		
1.51	Standard deviation	0.35		
1.45	Sample variance	0.12		
	Kurtosis	0.57		
	Skewness	-0.72		
	Range	0.98		
	Minimum	0.89		
	Maximum	1.87		
	Sum	8.82		
	Count	6		
	Confidence level (95.0%)	0.36		
CALCULATIONS				
2 X SD = 0.702				
Mean - 2SD = 0.767				
Mean + 2SD = 2.172				

## Interpretation:

90th percentile =

1.825

From the above it can already be estimated that this **HEG** is statistically correctly defined, as the mean value (1.47) falls within the "B Category" and the **90<sup>th</sup> percentile** value (1.825) also falls within the "B Category".

DOES 95% OF THE SAMPLES FALL WITHIN TWO STANDARD DEVIATIONS (SD) FROM THE MEAN?

- A) 95% of the samples must be between mean 2SD (0.7674) and mean + 2SD (2.173)
- B) From "DATA": 0 sample < mean 2SD0 samples > Mean + 2SD
- C) 0/6 = 0%

OCCUPATIONAL HEALTH PROGRAMME ON PERSONAL EXPOSURE TO AIRBORNE POLICITANTS

This is within the allowable 5% and therefore the HEG is statistically correctly defined.

DATA ALLOCATED	TO THE R	ETURN SIDE	DESCRIPTIVE STATIS	TICS	
	2.15		Mean	2.38	
	2.29		Standard error	0.05	
	2.32		Median	2.45	
1-9	2.54		Mode	#N/A	
	2.47		Standard deviation	0.13	
d	2.45		Sample variance	0.01	
10	2.48		Kurtosis	-0.26	
			Skewness	-0.80	
			Range	0.39	
			Minimum	2.15	
			Maximum	2.54	
			Sum	16.7	
			Count	7	
			Confidence level (95.0%)	0.12	
CALCULATIONS					
2 X SD	=	0.274434			
Mean - 2SD	=	-2.11128			
Mean + 2SD	=	2.660149			
90th Percentage	=	2.504			

Interpretation:

From the above it can already be estimated that this HEG is statistically correctly defined, as the mean value (2.39) falls within the "A Category" and the 90<sup>th</sup> percentile value (2.504) also falls within the "A Category".

OCCUPATIONAL HEALTH PROGRAMME ON PERSONAL EXPOSURE TO AIRBORNE POLLUTANTS

DOES 95% OF THE SAMPLES FALL WITHIN TWO STANDARD DEVIATIONS (SD) FROM THE MEAN?

- A) 95% of the samples must be between mean 2SD (-2.514) and mean + 2SD (7.286)
- B) From "DATA": 0 sample < mean 2SD and 0 samples > mean + 2SD
- C) 0/7 = 0%. This is within the allowable 5% and therefore the HEG is statistically correctly defined.

Step 6 - Paired T-test

#### GOVERNMENT GAZETTE, 6 APRIL 2018

OCCUPATIONAL DEALTH PROGRAMME ON PERSONAL EXPOSURE TO AIRCONGLUCTUATION

### **ANNEXURE C:** Mandatory classification bands

(Annexure C forms part of this guideline and must be complied with)

# CLASSIFICATION BANDS

CATEGORY	PERSONAL EXPOSURE LEVEL
A	Exposures ≥ the OEL
В	Exposures ≥ 50% of the OEL and < of the OEL
C	$\mbox{Exposures} \geq 10\%$ of the OEL and $< 50\%$ of the OEL
D	Exposures < 10% of the OEL

Pollutants (excluding toxic gasses and vapours)

Toxic gasses and vapours

#### CLASSIFICATION BANDS

CATEGORY	PERSONAL EXPOSURE LEVEL
A	Exposures ≥ the OEL
В	$\mbox{Exposures} \geq 50\%$ of the OEL and < of the OEL
C	$\textbf{Exposures} \geq 10\%$ of the OEL and $< 50\%$ of the OEL
D	Exposures < 10% of the OEL

NOTE: An activity area e.g. stoping is not a HEG, this activity area e.g. stoping, must be sub-divided into the classification bands as shown above. These classification bands are the HEGs within that particular activity area.

#### GOVERNMENT GAZETTE, 6 APRIL 2018

ANNEXURE D: Supplementary information for determination of HEGs (For information purposes only)

### 1. **DEFINITIONS**

"Occupational exposure limit (OEL)" means the time weighted average concentration for an eight-hour work day and a 40-hour work week to which nearly all workers may be repeatedly exposed without adverse health effects.

"Occupational exposure limit - ceiling limit (OEL-C)" means an instantaneous value, which must never be exceeded during any part of the working exposure.

"Occupational exposure limit - short term exposure limit (OEL-STEL)" means a 15-minute TWA exposure that should not be exceeded at any time during a workday even if the eight-hour TWA is within the OEL-TWA. Exposures above the OEL-TWA up to the STEL should not be longer than 15 minutes and should not occur more than four times per day. There should be at least 60 minutes between successive exposures in this range. An averaging period other than 15 minutes may be recommended when observed biological effects warrant this.

For those substances for which no OEL-STEL have been specified, excluding airborne particulates, a figure of three times the occupational exposure limit is to be used when controlling short-term excursions in exposure.

"Respirable particulates" means the respirable fraction of airborne particulates.

"Inhalable particulates" means the inhalable fraction of airborne particulates.

# EXPOSURE STANDARDS FOR PARTICULATES NOT OTHERWISE CLASSIFIED (PNOC)

Not all dusts have assigned **exposure** standards. However, it should not be assumed that this indicates that these unlisted particulates do not represent a hazard to health.

No. 41561 123

#### OCUUPATIONAL HEALTH PROGRAMME ON PERSONAL EXPOSURE TO AIRBORNE POLLUTANTÉ

In addition to any specific physiological effect related to the unique properties of an individual particulate, high concentrations of particulates in the workplace may cause unpleasant deposition of dust in the ears, eyes and upper respiratory tract, and reduce visibility in the workplace. In addition, the mechanical action of these dusts, or the cleaning procedures necessary for their removal, may cause injury to the skin or mucous membranes.

Where no specific **exposure** standard has been assigned and the substance is both of inherently low toxicity and free from toxic impurities, the recommended **exposure** standard for **PNOC** in general should be 10mg/m<sup>3</sup> for inhalable particulates and 3mg/m<sup>3</sup> for respirable particulates. However, this general **exposure** standard should not be applied where the particulate material contains other substances, which may in themselves be toxic or cause physiological impairment at lower concentrations. In such circumstances, the **exposure** standard for the more toxic components should be applied. For example, where a dust contains asbestos or more than one per cent crystalline silica, such as quartz, cristobalite or tridymite, the **exposure** to these materials should not exceed the appropriate value for these substances.

Providing the airborne particulate does not contain other hazardous components, compliance with the **exposure** standard for dusts in general should prevent impairment of respiratory function even over many years of **exposure**.

### 3. MIXTURES OF SUBSTANCES

The **exposure** standards listed in this document are applicable to airborne concentrations of single pure substances. In practice, however, a working environment may contain a number of **airborne pollutants** and **exposure** to these additional substances, either simultaneously or sequentially, could give rise to an increased hazard to health.

Although the following proposals have been made to deal with mixtures, in several specific cases, the application of **exposure** standards to environments containing mixtures of pollutants requires considerable caution. The interaction of any particular mixture of substances should be assessed by either toxicologists, occupational

#### GOVERNMENT GAZETTE, 6 APRIL 2018

OCTUPATIONAL REALTH PROGRAMME ON PERSONAL EVPOSURE TO KIRRORNE POLLUTANTE.

hygienists or physicians after specific toxicological consideration of all substances involved:

- Independent effects.
- Additive effects.
- Synergism and potentiation.

### 3.1 Independent effects

Where there is clear toxicological evidence to indicate that two or more pollutants have totally distinct mechanisms of effect on the body, each substance may be separately evaluated against its appropriate **exposure** standard. For example, since crystalline silica affects the lungs, and inhaled ethanol vapour acts upon the liver and central nervous system, each of these substances may be assessed individually against its appropriate **exposure** standard. If neither standard is exceeded, the atmosphere within the working environment is deemed to be satisfactory.

### 3.2 Additive effects

When the body is exposed to two or more contaminants, an additive effect is obtained when pollutants have the same target organ or the same mechanism of action. In this situation, the total effect upon the body equals the sum of effects from the individual substances.

When assessing the hazard from a mixture of airborne contaminants, it is important to identify and quantify all components in the airborne mixture as a number of factors, such as particle size distribution or solvent vapour pressure, can give rise to substantial variations between the concentration of each component in the parent mixture and that which occurs in air.

Although an example of an additive effect is the general effect of organic solvents on the central nervous system (narcotic or anaesthetic effect), the **exposure** standard for a number of solvents, such as benzene and carbon tetrachloride, have been assigned on the basis of effects other than those on the central nervous system.

CODMINIONAL HEALTH PROGRAMME ON PERSONAL EXPOSURE TO ARBORNE POLITIKITS Therefore, it is essential to refer to the documentation for the specific substances to ascertain the basis of the standard and any potential interactions.

#### GOVERNMENT GAZETTE, 6 APRIL 2018

OWNERATIONAL REALTHER OGRADUE FOUTER SYNCE EVEL SUPERIORADINE FOLLO FOR

### 3.3 Synergism and potentiation

Sometimes the combined effect of multiple **exposures** is considerably greater than the sum of the effects from the individual components. This phenomenon can be one of synergism or potentiation. Synergism occurs when both chemicals have an effect individually and a more than additive effect when together. Potentiation is when one chemical has an effect, but the second chemical does not, but enhances the effect of the former chemical on combined **exposure**.

An example of a synergistic effect is the combined effect of solvents such as nhexane and methyl ethyl ketone (MEK) on the nervous system. In combination, the damage caused by simultaneous high concentrations of both these solvents is far greater than the sum of either of these substances acting alone.

Interaction can also arise from exposures via routes other than inhalation. For example, imbibed alcohol increases the narcotic effects of inhaled trichloroethylene. Interaction effects may also occur in connection with exposure to entirely different environmental factors such as simultaneous exposure to chemical agents and physical factors, such as light, heat and noise. Smoking of tobacco is known to have a synergistic effect in combination with, for example, inhaled particulates.

At present the understanding of interaction effects is incomplete. The knowledge that such effects can occur is reason to maintain the concentrations of individual substances as low as is practicable under complex **exposure** conditions.

ANNEXURE E: Background information, sampling and analysis on particulates (For information purposes only)

This annexure provides background information on particulates, details sampling and analysis methodologies.

### 1. SAMPLING METHODOLOGY AND ANALYSIS FOR AIBORNE PARTICULATES

- 1.1 Gravimetric sampling of airborne particulates will be used as a basis for measuring environmental conditions and expressing the results as a concentration in milligrams per cubic meter of air (mg/m<sup>3</sup>).
- 1.2 Instruments shall make use of a constant volume pump or other means for the constant aspiration of air. Volume flow rates are to be calibrated before and checked after each sample with the sampling train in line, using the volume displacement method (soap bubble method) as the primary standard; the required flow rate will be dependent on the sampling methodology. Samples are to be discarded if the flow rates vary by more than 5% (elutriator or cyclone efficiency for particle size selection is dependent on flow rate).
- Filter media suitable for the various applications will depend on the sampling methodology adopted.
  - 1.4 Mass determination of filters is to be done by using micro-balances capable of reading to the nearest 10 micrograms.
  - 1.5 Samples, once taken, are to be transported in such a manner that any possible particulate loss resulting from bumping, vibration or being transported is minimised. Filters should be transported with the dust deposit side facing upwards.
    - NOTE: The use of the public postal system or other public transport services does not satisfy the above requirements.

OGCUPATIONAL NEWLTH PROGRAMME COCCUPATIONAL BY GIFNE AND MEDICAL STRVEILL GV. FT ON PERSONAL EXPOSIBLE TO A REDEPINE POLITICITY

### 2. STANDARD PROCEDURE FOR THE ASSEMBLY OF THE SAMPLING TRAIN

### 2.1 Introduction

Filters are used to sample airborne chemical hazards in particulate form. Particulate samples are collected using a small, porous filter typically 25mm or 37mm in diameter. A cyclone is used when the measurement of respirable dust is required. Respirable dust particles are those particles small enough to reach the alveoli of the lung. When using a cyclone, the larger particles will be removed from the air by centrifugal force and fall into the bottom of the cyclone, while the smaller particles (respirable) will pass through the cyclone and be collected on the filter.

### 2.2 Equipment required

- Air sampling pump capable of sampling at the recommended flow rate with the sampling medium in line.
- b) Air flow calibrator, such as an electronic calibrator.
- c) Filters, support pad or, screen and cassette blanks as specified in the method
- d) Cyclone, size as specified in the method.
- e) Filter cassette holder.
- f) Optional equipment, such as cassette sealing bands.
- g) To determine the correct flow rate for the chemical being sampled, refer to the appropriate analytical method.

#### 2.3 Preparing the filter cassette

The filter cassette is used to hold the filter securely in place during sampling. The cassette consists of an inlet, an outlet and possibly a middle ring or extension cowl.

CELLEVATIONAL VEALENT PROCEASABLE IDECLEVATIONAL HIGHER AND MELICIAL SUPPLILLANCE. ON PERSONAL PAROSURE TO APROPRIATE POLITIANTS

The cassette with all three sections can be used with the inlet in place (closed face) or with the inlet removed (open face) depending on the method.

2.3.1 Without cyclone - see Figure D1

To load the cassette, place a cellulose support pad or stainless-steel screen in the outlet of the cassette and add the appropriate filter. Add the extension cowl or middle ring if required then close the cassette firmly with the inlet. Insert the plugs into the inlet and outlet.

Figure D1: Filter assembly

2.3.2 With cyclone - see Figure D2

Figure D2: Filter assembly with cyclone attached

CONFACTORIAL HEALTH PROGRAMME (OCCUPATIONAL INVOLVE AND MEDICAL FURDERLANCE) ON PERSONAL EXPOSURE TO ARROPHE FOR UTANTS

Place a cellulose support pad in the outlet of the cassette and add the appropriate filter. Add the middle ring and place the cyclone securely into this ring. Insert the plug into the cassette outlet. The cyclone must meet the ISO/CEN/ACGIH size selective curve.

### 2.4 Setting up the sampling train

### 2.4.1 Without a cyclone

Ensure that the pump is in the correct flow mode. When calibrating the flow use the sampling train that is to be used in the field. Remove the plugs from the cassette and use flexible tubing to connect the filter outlet to the pump intake and the filter inlet to the external flow meter.

### 2.4.2 With a cyclone

Ensure that the pump is in the correct flow mode. When calibrating the flow, use the sampling train that is to be used in the field. Insert the cyclone calibration chamber over the cyclone and ensure that it fits securely to avoid leaks. Remove the plug from the cassette and use flexible tubing to connect the filter outlet to the pump intake and the calibration chamber to the external flow meter. The cap on the stem of the cyclone (grit pot) should remain in place during calibration and use. The cyclone must meet the ISO/CEN/ACGIH convention for respirable particulate sampling.

## 3. SAMPLING

Prior to sampling commencing you may want to seal the cassette with a cellulose band to prevent leakage from occurring. Secure the cassette and attach the adapter on the end of the short piece of rubber tubing to the outlet of the cassette. Then connect the long piece of flexible tubing to the inlet of the pump. Attach the filter holder in the worker's breathing zone and the pump to the worker's belt (pumps are sometimes placed in a protective leather pouch and the whole harness strapped to the chest or back of the person being sampled, with the filter assembly in the

CONFACTIONAL NORTH PROGRAMME (COOUPASIONAL HISSIENE AND DEDICH, STIPLETUSINEE) ON PERSONAL EXPOSURE TO OPPONNE POLIAITANTS

worker's breathing zone). The inlet of the cassette should be facing down. If a cyclone is being used, it should be placed in a vertical (downwards) position. Remove the plug from the cassette inlet if applicable and turn the pump on. Note the start time and any other pertinent sampling information.

### 4. AFTER SAMPLING

At the end of the sampling period, turn the pump off and note the stop time. Using a calibrated flow meter, check the flow rate to verify that the flow has not changed by more than 5%.

Remove the filter cassette from the holder and cap the inlet and outlet of the cassette with the plugs provided. If a cyclone was used, remove the cyclone and discard the dust in the grit pot. Close the cassette firmly with the inlet, and cap the inlet and outlet with the plugs. When removing cassettes from the sampling train, handle carefully to avoid losing the sample.

Pack the sample filter and all pertinent sampling information securely for transportation to the weighing facility for post-weighing.

The main problem associated with the assembly of filter cassettes and cyclones (sampling train) is that of possible particulate mass loss due to internal leakages (airflow past the filter paper) and/or external leakages (through connections, faulty cyclones or damaged filter cassettes).

### 5. VISUAL EXAMINATION

Visual examinations necessary to minimise leakage are as follows:

### 5.1 External leakages

(i) Grit pots at the bottom of cyclones must be tight fitting and with no cracks or cuts. Cable ties or clamps may be necessary in some instances.

No. 41561 135

COCUMATIONAL HEALTH PROGRAMME LOCCUPATIONAL HYGENE AND MEDICAL TUP" CLI ANCE, ON PERSONAL EXPOSURE TO AIRBORIZ POLILITANTS

- (ii) Check that rubber 'O'-rings, where fitted, are in good order.
- (iii) Check each segment of the filter cassette for cracks. The various segments must be firmly pressed together to ensure that the filter media and support pad are well nipped. Wrap the joints with a good quality insulation tape or shrink seal.
- (iv) Cyclones must be critically examined for loose screws, missing gaskets, perished or oversized rubber 'O'-rings, broken or cracked parts etc.
- (v) Good quality transparent tubing, in good condition (no cracks or weak areas), must be used. All connections must be fitted with cassette adaptors, cable ties or clamps. Tube connections must be made over outlet parts. Insert-type connections must be avoided.

### 5.2 Internal leakages

- (i) Check that the rubber 'O'-rings are in good order where fitted.
- (ii) Fit the pre-weighed filter paper precisely on top of a new support pad (a metal support grid is not recommended) inside the filter cassette. Ensure that the filter media faces the intake airside of the assembly.
- (iii) For a proper seal check that the filter cassette rides on the small rubber 'O'-ring inside the cyclone before assembly. Secure the threaded plastic ring firmly.

### 5.3 General

(i) All instruments must be cleaned after use with a damp cloth, which has been submerged in a mild solution of detergent and water.

COOPATIONAL NEALTO FRAMEWARD COOLURATIONAL OF GREEKE AND MEDICAL SURVEILLANDER INTERSONAL FARE SCHEET DAME PARE POLILITAATS

- (ii) Cyclones and plastic cassettes must be washed in a mild solution of detergent and water. Rinsing with water should be followed up with a final rinse in methyl alcohol after which they should be allowed to dry.
- (iii) The use of an ultra-sonic bath is also recommended for the cleaning of cyclones and cassettes.
- (iv) Due to the possible contamination of filters, Vaseline or silicone grease is not recommended for sealing purposes.
- (v) A good seal is indicated when the edge around a used filter paper, where the two interlocking segments of the cassette make contact with the filter paper, is free of particulate matter.
- (vi) The removal of the cyclone body from the cassette must be done slowly and with great care so as not to dislodge any collected particulate matter from the filter.
- NOTE: Filter holders should be removed from the cyclone at the end of sampling for transport to the weighing facility with the dust deposit side facing upwards. Unnecessary movement or handling before transportation is undesirable.

### 6. SAMPLING METHODOLOGY

### 6.1 Introduction

As small quantities of particulates are collected in personal gravimetric sampling, the most practical method of assessing such quantities of particulates is to establish the mass of the clean filter before sampling, and then to observe the increase in filter mass due to the particulates collected on the filter. In principle, the difference between the "before sampling" mass and the "after sampling" mass represents the mass of particulates collected.

OCCOPATIONAL FEALTH FROM AMAL OCCUPATIONAL PYOIENE AND MEDILAL ORDER OF A PRIMA PROVIDENCE AND A DRIVER OF A PROVIDENCE AND A DRIVER OF A PROVIDENCE AND A DRIVER OF A DRIVERO

There are, however, factors which could affect the particulate mass measurements. These include:

- Variation in filter mass due to absorption or desorption of moisture between the "before"- and "after" sampling mass determinations.
- (ii) The basic limitations of instrumentation, weighing procedure and competency of staff.

This standard weighing procedure incorporates practical means for alleviating these problems.

### 6.2 Requirements of sampling pump

A portable battery powered pump must be used for personal sampling. The capacity of the battery must be sufficient to operate continuously over the chosen sampling time. The pump should be capable of maintaining the required flow rate with a variation within ±5% for the entire sampling duration, allowing for increasing filter loads. Pumps with automatic flow control facilities are recommended. The performance characteristics of field sampling pumps vary considerably and reference should be made to experienced laboratories for selection of pumps for specific sampling applications.

The flow must be sufficiently free from pulsation. As a minimum and tentative criterion, there must be no visible vibration of a rotameter float, if such a flow meter is connected to the filter holder with the filter inserted. It may be necessary to install a pulsation damper between the pump and the filter if an internal pulsation damper has not been included or if the pump shows significant pulsation.

Connecting tubing must be constriction-proof and the connections leak proof.

CAUTION: When sampling in explosive gas or dust atmospheres, ensure that the sampling pump is intrinsically safe.

COUPATIONAL IF ALTH PROGRAMME OCCUPATIONAL IN GRIVE AND MEDICAL SUPPEIL MENT ON RESOLVAL EXPOSIBLE TO A MECANE POLICITANTS

#### 6.3 Calibrating a pump with an electronic calibrator

Personal sampling pumps are essential tools for sampling airborne contaminants. However, the determination of airborne concentrations requires accurate knowledge of the volume of air sampled. This value depends upon the constancy of the flow rate of the pump, and upon the reliability of the means of measuring that rate.

Built-in rotameters on sample pumps are not precision instruments and cannot be used to determine a pump's flow rate. These devices provide only an approximation. Flow rates should be measured with an instrument such as an electronic calibrator, which bases measurement on the unchanging physical dimensions of an enclosed volume. A precision rotameter can also be used, but only if its calibration is traceable to a device such as an electronic calibrator or a film flow meter, and the rotameter is capable of maintaining accuracy with reasonable care and handling. Unlike an electronic calibrator, a precision rotameter requires periodic calibration.

#### Equipment required

- An air-sampling pump capable of sampling at the recommended flow rate with the sampling medium in line;
- An electronic calibrator (or precision rotameter);
- The sampling media as specified in the method; and
- Any additional equipment specified in the method.
- a) Setting up the electronic calibrator

Pour a small amount of film solution into the bottom opening of the flow cell. The amount of solution is not critical, but the solution level should just cover the bottom of the flow cell. A large amount of soap may cause a stream of bubbles at high flows. OUT OF MIDNAL REACTH PROGRAMME (GOLDANIONAL HYGENE AND MEDICAL RUD IT CLANGE) ON REREDIAL EXPOSURE TO ARE AND REPOLIDANTS

#### b) Setting up the sampling train

Prepare an appropriate sampling train as specified in the method. Ensure that the pump is in the appropriate mode (high- or low-flow) for the desired flow rate, and that any necessary flow accessories (such as pressure controllers) are in place. With flexible tubing, connect the outlet of the sampling media (filter cassette, sorbent tube, impinger, etc.) to the inlet of the pump.

c) Calibrating the flow rate

Turn on the pump and allow approximately five minutes for stabilisation. Connect the inlet of the sampling media to the electronic calibrator (see Figure D3). Make this connection with the shortest tubing length possible and avoid kinks and bends in the tubing for accurate measurements.

NOTE: Some electronic calibrators have two fittings: one for negative pressure and one for positive pressure. Please refer to your calibrator operating instructions for the proper fitting selection.

Prepare the calibrator for use by ensuring that the flow cell is completely wet with bubble solution. To wet the flow cell, start the soap film travelling up the flow cell by repeatedly pressing and releasing the plunger button or squeezing the rubber bulb. Continue to generate bubbles until the bubbles travel the entire length of the tube without breaking and the flow cell is completely wet with bubble solution.

To calibrate the flow rate, start a single bubble travelling up the flow cell by pressing the button or squeezing the bulb. Observe the bubble passing through the tube. The bubble must travel the entire length of the tube for an accurate measurement. A flow rate is displayed on the calibrator LCD. Perform a minimum of three readings to accurately determine the flow rate.

Using the flow adjust control on the pump, increase or decrease the flow rate until it approximates the desired flow rate as specified in the sampling method.

CONSTRUCTION OF ALTER PROGRAMME OCCUPATIONAL INSIGHT AND MEDICAL SUPPRIMANCE. IN PERSONAL EXPOSITING TO APPROXIME FOLLOWING

Several readings and adjustments may be needed until the desired flow rate is achieved.

d) Sampling

When ready to begin sampling, set up a calibrated sampling train. Use preprepared sampling media of the same type. Attach the sampling media to the worker's clothing within the breathing zone and the pump to the worker's belt. Activate the pump and note the start time.

e) After sampling

At the end of the sampling period, turn the pump off and note the stop time. Using the calibrator, measure the flow rate following the directions outlined earlier. Record this value as the "post-sample" flow rate. Compare the presample and post-sample flow rates to ensure that the two flow rates do not differ by more than 5%. The average of the pre-sample and post-sample flow rates should be reported to the weighing facility along with other relevant data including the sample time. Remove the sampling media, seal the sampling media for transport to the weighing facility and record pertinent sampling information.

Figure D3: Air sampling pump connected to an electronic calibrator

COUNTRING FRANKLINE OF PROGRAMME OCCUPATIONAL HYDRENE AND MELLOUL THE "CHARTONIAL BORD SUBELIC MIRNOR ME POLICITAL IS

### 6.4 Calibrating a pump with a film flowmeter

### 6.4.1 Equipment required

- Air sampling pump capable of sampling at the recommended flow rate with the sampling medium in line;
- Film flow meter air flow calibrator or precision rotameter;
- Precision timing device;
- The sampling media as specified in the method; and
- Any additional equipment specified in the method.

### 6.4.2 Introduction

To determine the correct flow rate for the chemical being sampled, refer to the appropriate analytical method. Please refer to the operating instructions for the pump to ensure that it is capable of sampling at the correct flow rate.

a) Setting up the film flow meter

Some film flow meters come with a separate stand or base. If so, stand the glass tube vertically using the base so that the rubber squeeze bulb is at the bottom. If no base is provided, use lab clamps and a support stand. Remove the rubber cap from the lower side arm of the glass tube. Pour film solution into the lower side arm so that the solution enters the rubber bulb and the level of the solution is about 1/4 inch (6-7 mm) above the upper rim of the bulb. The solution level should not reach the side arm of the tube. A pipette may facilitate the filling procedure. Alternatively, film solution can be introduced through the top of the glass tube. Simply remove the stopper, tilt the tube and pour gently. When operating the flow meter, the cap must remain off the side arm.

CONFARIONAL MEAL PERSONAL EXPOSURE TO SIRVAL BY GREAT AND MEDICAL BURNERICANCE TO SIRVARY POLITICALS.

#### b) Setting up the sampling train

Prepare an appropriate sampling train as specified in the method. Ensure that the pump is in the appropriate mode (high- or low-flow) for the desired flow rate, and that any necessary flow accessories are in place. With flexible tubing, connect the outlet of the sampling media (filter cassette, sorbent tube, impinger, etc.) to the inlet of the pump. Connect the inlet of the sampling media to the outlet (upper port) of the film flow meter.

c) Calibrating the flow rate

Remove the rubber cap from the lower side arm of the flow meter. Turn on the pump. While the pump is operating, repeatedly squeeze the rubber bulb at the base of the glass flow meter tube until a flat soap bubble (film) enters the tube and rises up the column. Introduce several bubbles into the tube to wet the tube interior so that the soap film successfully travels the entire length of the tube. Observe the soap film as it passes the volume lines marked on the glass tube. Using a stopwatch or other precision timing device, accurately determine the time it takes for a single soap film to travel from one volume line to another. This time, together with the volume delineated on the tube, represents the flow rate:

Flow rate = volume bubble travels (ml or L) / time it took to travel (min)

Using the flow adjust control on the pump, increase or decrease the flow rate until it approximates the intended flow rate as specified in the sampling method. Several measurements and adjustments may be needed until the desired flow rate is achieved.

d) Determining the flow rate

Once the desired flow rate has been achieved, accurately measure the flow rate at least three times using the flowmeter in the manner described above.

#### GOVERNMENT GAZETTE, 6 APRIL 2018

N. CUPATIONAL (IEAL IN ADVGRAMME OCCUPATIONAL MYSIERE AND MEDICAL SURVEILIANCE) ON ARRIVAL EXPANSION OF AGEORNE POLLITANTS

(Do not adjust the pump's flow adjust control this time.) Average the results. Record this averaged value as the "pre-sample" flow rate.

### e) Sampling

When ready to start sampling, set up a new sampling train identical to the one used to measure and calibrate the flow. Use new sampling media of the same type. Do not discard the sampling devices that were used to calibrate the flow; these will be used to check the flow again when sampling is completed. Attach the sampling media to the worker's collar and the pump to the worker's belt. Activate the pump and note the start time.

### f) After sampling

At the end of the sampling period, turn the pump off and note the stop time. Remove the sampling media, seal the ends and record pertinent sampling information.

#### g) Rechecking the flow

Reattach the sampling media originally used to calibrate the flow rate of the pump (if these are not available, use new media). Using the flow meter, measure the flow rate following the directions outlined in step 4. Record this averaged value as the "post-sample" flow rate. Compare the pre- and post-sample flow rates to ensure that the two flow rates do not differ by more than 5%. The average of the pre- and post-sample flow rates will be reported to the weighing facility along with other relevant data.

### 7. FILTERS

The selection of a particular filter type for a specific application is invariably the result of a compromise of many factors. These factors include cost, availability, collection efficiency, analytical requirements and the ability of the filters to retain its filtering properties and physical integrity under the ambient sampling conditions. The CEUPACONAL HEATTH PROGRAMME COCURE ODAAL HUGIENE AND MEDICAL SCHOOL DARCET ON PERSONAL SYPOSAUSE TO MERIOR & POLICIANTS

sampling methodology adopted will determine the type of filter required. Recognized methodologies such as HSE or **NIOSH** analytical methods must be consulted,

A suitable backing pad is required to support the filter disk in the cassette.

### 7.1 Correction for the influence of moisture

Due to the hygroscopic nature of most filters, it is necessary to quantify any variation in their moisture content. Reference filters are thus used in the weighing procedure as follows:

- Reference filters always remain in the weighing room and are weighed during both the "before" and "after" mass determinations of field filters.
- Any variation in mass between the "before" and "after" mass measurements will reflect the change in moisture content. This variance is then accordingly used to correct the mass of the field filter.

### 7.2 Weighing errors

A maximum allowable variation of 0.05mg in the mass of filters in three consecutive weighings of the same filter, is allowed. Should these three measurements vary by more than the value mentioned above repeated mass determination must be performed.

### 7.3 Preparation of filters

An important step in ensuring accurate results and records is the correct marking and preparation of filters.

### 7.4 Identification of filters

(i) Filters from individual packs must be readily identified by means of a suitable marking system. A ball point pen can be used to mark filters. Marking to be

#### GOVERNMENT GAZETTE, 6 APRIL 2018

ICT I PADONSE HEALTH POOGRAMME (OCCUPATIONAL HYGENE AND MELICAL SURVEY EALCH) I'M FERSIMAL EXPOSURE TO AIRPORNE POLITICIATS

done on the backing-pad facing down to be readable from the bottom as the chemicals in ink sometimes interfere with chemical analyses.

- (ii) In order to ascertain the hygroscopic character variances between individual filters with acceptable accuracy, three reference filters must be selected from each batch/pack which must not contain more than 100 filters.
- (iii) These field and reference filters must be stored in petri-slides until needed.

### 7.5 Treatment of filters prior to weighing

### Filters

- (i) At least 12-hours before filters are due to be weighed the required number must be placed in a partially open Petri slide/dish in the stabilisation cabinet/chamber.
- (ii) At the same time the Petri slide/dish containing the relevant reference filters must be partially opened and placed in the same cabinet/chamber for the same period of time.

### 8. STORAGE/TRANSPORTATION OF SAMPLES

- 8.1 Description of carrying case (minimum requirements)
  - The handle must be positioned as to ensure that samples remain "dust deposit side facing upwards" at all time.
  - The case should be constructed to prevent inadvertent opening during handling or transport.
  - The case should have markings to indicate "right side-up".
  - The case should be lined with a low-density sponge with suitable recesses for samples to protect them against shock and vibrations.

OCCUPATION+1 INEPLTY PROGRAMME, COOLINATIONAL INFORMETING AND MEDICAL SOME ENTRY INFORMATION ON PERSONAL EXPLOSUED IN A IPEORME POLY (ITAMITS)

### 8.2 Method of transport between working place and weighing room

Briefing of persons responsible for transporting the sample carrying case.

# 8.3 Storage of samples before transportation to weighing facility/analysing authority

Samples awaiting transport are to be kept "right side-up" in a suitable cabinet or in a suitable foam-lined carrying case.

### 8.4 Method of transport between concern and analysing authority

Public couriers, unless a specialised service, are not acceptable, only persons briefed on the contents and transport requirements may be used.

### 9. WEIGHING ROOM

### 9.1 The following points should be considered when selecting a weighing room:

- (a) The location of the weighing room should be in an uncontaminated, dust free environment and away from any activity or equipment that can cause vibration.
  - (b) To avoid draughts and the ingress of dust, windows, if fitted, must at all times be kept closed (sealed) and the entrance to the weighing room must preferably be through an airlock or otherwise a self-closing door (any other condition that may affect a stabilised atmosphere must be addressed).
  - (c) Commercial air conditioners are not acceptable unless they are of the type designed to maintain a constant humidity and temperature.
- (d) This room must be dedicated to the weighing and preparation of filter cassettes.
  - (e) The following signs should be displayed at the entrance to the weighing room:

#### GOVERNMENT GAZETTE, 6 APRIL 2018

11 COPACIONAL PERIOD PROGRAMME UN COMPACIN, NEL REDREE AND MEDICAL SCIENCED FOR T ON PERSONAL EXPOSURE TO AIRBORNE FOLLUTANT:

- (i) Weighing room.
- (ii) No smoking.
- (iii) No acclimatisation in progress (when applicable).
- (iv) Weighing in progress (when applicable).

### 9.2 The transparent weighing/stabilisation cabinet

The transparent weighing/stabilisation cabinet may be used in conjunction with or in lieu of the weighing room and subject to the following:

- (i) The criteria for filter weighing, as described in this supporting document must, as far as is compatible with the new method, be adhered to.
- (ii) The construction of the cabinet should conform to the following:
  - (a) Dimensions

The minimum dimensions shall be:

0,8m length 0,5m width 0,5m height

(Dimensions resulting in a smaller volume than that reflected above [0,2m<sup>3</sup>] will be problematic as it was found that the human body does affect the temperature and humidity inside the cabinet during the weighing process).

(b) The cabinet body

The cabinet body should be constructed of an angle strip metal frame housing not less than 3mm thick transparent Perspex (or glass) panels bolted or screwed to the metal frame. The metal used should be a good ON PERSONAL EXPOSITION AND ADDRESS TO ADDRESS AND DEDUCTOR SURVEILLANCE.

conductor so as to assist in discharging static electricity from the Perspex panels. The body should consist of four side panels and one top panel.

### (iii) Static electricity

- (a) The cabinet shall be placed on an anti-static mat of slightly larger dimensions than the cabinet itself without any sealing material between the metal frame and the anti-static mat.
- (b) The metal frame of the cabinet shall be properly earthed independently of the anti-static mat.
- (iv) Surroundings
  - (a) The cabinet must not be exposed to wide variations in temperature and humidity. The following are examples of undesirable situations:
    - The cabinet must not be exposed to direct sunlight.
    - If an air-conditioning unit is operated in the same room it must not be switched on and off according to whim but must be kept running constantly to keep the temperature and humidity reasonably constant. The same principle applies to heaters during winter.
    - Kettles must not be boiled in the same room as it creates a sharp increase in the humidity.
  - (b) Pollution of the surroundings of the cabinet by dust, cigarette smoke, etc. must be avoided.
  - (c) The balance table, anti-static mat and cabinet must be dedicated solely to the purpose it was provided for.
- (v) Acclimatisation

#### GOVERNMENT GAZETTE, 6 APRIL 2018

OCUPATIONAL MEALCH PRODUCAMME COOCUPATIONAL AVGIENE AND MEDICAL SURVEIL CANCE : DAL PERSONAL EXPOSURE TO AIRBORNE POLLUTANTS

Both reference and field filters due to be weighed must be acclimatised for at least 12-hours. Steps must be taken to ensure that the cabinet is not lifted up or any of the apertures opened up during the acclimatisation period.

### 9.3 Weighing room equipment

(i) Filter weighing

A balance capable of weighing to the fifth decimal point of a gram is required e.g. reading to the nearest 10 micrograms.

- (ii) The following is required with regard to weighing room equipment and practice:
  - (a) The balance, correctly levelled must stand on a rigid specially designed balance table on a properly earthed anti-static mat.
  - (b) The balance must remain uncovered at all times and if possible the side doors left slightly open to allow air circulation during the acclimatisation period.
  - (c) The balance must be regularly maintained and calibrated and a record kept. It is strongly recommended that a standard weight be used to check the accuracy of the scale in the interim periods.
  - (d) An additional anti-static mat for disassembly of cassettes is required.
  - (e) Sufficient storage space for filters and associated equipment must be provided.
  - (f) A filter stabilization chamber or cabinet so designed as to allow free air circulation should be provided.

No. 41561 151

DC 10 AVK-XAL 30ALTH PROGRAMME OCCUPATIONAL AVGIENE AND MEDICAL SUPPERTABLE) ON PERSONAL EXPOSURE TO AIRBUSINE POLICITARY 3

(g) Carpets are not allowed in the weighing room because of problems of static build up unless they are manufactured and installed according to the South African Bureau of Standards' specifications.

### 9.4 Weighing room accessories

- (a) Suitable spring-loaded tweezers for handling filters.
- (b) Petri slides/dishes.
- (c) Suitable marking pen. Ball point for filters.
  - (d) Suitable means for recording weighing.
  - (e) Non-static cloth for cleaning purposes.

### 9.5 Weighing procedure

9.5.1 Filter weighing procedure

Switch on the balance and leave it to "warm up" for at least 30-minutes. Certain balances, provided the power is on, remain in a "standby" mode and in such a case no warm up period is needed.

In order to facilitate the removal of filters from the weighing pan it is recommended that a small 'O'-ring of an impervious material be positioned in the centre of the pan. An added advantage of using an 'O'-ring is that all weighing takes place at a centralised position on the weighing pan so avoiding corner load errors.

Weigh the three reference filters simultaneously or individually, three consecutive times. These three filters remain allocated to the remainder of the field filters from that batch of field filters for mass correction purposes.

#### GOVERNMENT GAZETTE, 6 APRIL 2018

CHARLES COMAL HEAT TO PROCRACING VC DUPATICING, HYDO DH, AND MEDICAL SUB-SECTION I. ON REESONAL EXPOSURE TO AIRSTRUE POLI OF SMRS

If weighed simultaneously the three reference filters should be placed evenly around the centre of the weighing pan.

Weigh each of the first 10 field filters three times consecutively.

Repeat the weighing of the three reference filters (this serves as a dual function: a check on the stability of the weighing room atmospheric condition and for mass correction on the following batch of field filters).

If the difference is 0,1mg or less per filter proceed to weigh the next 10 field filters. If the difference is greater than specified above, the weighing room environment is unstable and the reference filters must be weighed more often. Also re-weigh the previous 10 field filters.

- NOTE: Samples once taken, are to be transported in suitable containers so as to minimise any possible particulate loss resulting from bumping, vibration or being transported in the inverted position. Filters should be transported with the dust deposit facing upwards.
- 9.5.2 Particulate mass determination (mg)
  - a) Mass 1 (before sampling):
    - (i) Mass of field filter and moisture content.
    - Mass of each reference filter (normally three reference filters are used). If reference filters are weighed in batches of three, one third of the measured mass must be taken.
  - b) Mass 2 (after sampling):
    - (i) Mass of field filter, particulates and moisture content.
    - (ii) Mass of reference filter and moisture content.

No. 41561 153

OCUPATIONAL MENT TH PROSENTING COCUPATIONAL WIGHER AND MEDICAL BUR VEH LANCE. ON PERSONAL EXPOSURE TO ARRORNE POLUTANTS

c) Gross mass of particulates and moisture content on filter:

Mass 2 (b) (i) - Mass 1 (a) (i).

d) Correction factor for moisture content change (derived from reference filters):

Mass 1 (a) (ii) - Mass 2 (b) (ii).

This gives a + or - factor.

e) Absolute mass of the particulates on the filter:

Gross mass (c) + or - correction determined in (d)

NOTE: Any apparent negative value for the particulate mass must be examined critically and the reasons for this carefully analysed.

### 9.5.3 Remarks

- a) The above procedure is the minimum requirement for particulate mass determination.
- b) Wetted filter media, which have obviously been damaged physically, must be discarded. Others may be dried and weighed after the normal acclimatisation period. All filters, which appear to have been tampered with, must be discarded and air samples re-taken as soon as possible. Pre-weighed field filters together with their respective reference filters are preferably to be used within a period of three months.
- c) Dust samples for radiation monitoring are conducted using the same methodology and quality assurance.

#### GOVERNMENT GAZETTE, 6 APRIL 2018

ACCURATIONAL MEALTH PRESERVAGE AND THEATH MAN MYSIC MEALURAPHICS. SUBJELL AT THE 7 N SERVICIAL CONTROL OF THREE ORDERATES AND AND A CONTROL FOR DEPARTMENT.

### 10. ANALYSIS

The analysis and quality control must be in accordance with internationally recognised methods such as **NIOSH** or HSE standards.

A cellulose nitrate or a mixed ester of cellulose filter should be used if analysis is required. The sample must be forwarded to an accredited chemical analytical laboratory to determine the chemical composition of the collected sample.

Brief descriptions of the various analytical methods are included to help the occupational hygiene practitioner in discussions with the analyst and to make sure that the samples collected will be suitable for analysis - it is not to train the occupational hygiene practitioner in analytical techniques.

### 10.1 Atomic absorption spectrometry (AAS)

This is a common method used for analysis of metals such as:

- Lead.
- Cadmium.
- Nickel.
- Copper.
- Zinc.

There are some 60-70 metallic elements, which can be analysed individually by this technique, which uses the fact that atoms in a vapour absorb light at specific wavelengths.

### 10.1.1 Basic operation of an AAS

The metal particulate is dissolved into a solution by immersing and heating the filter in a solvent (typically a diluted acid). Part of this solution is aspirated (sucked) into a flame, which vaporises first the solvent and then the metal. All vaporised atoms of solvent and metal pass into a chamber through which a beam of light

# SAUGATIONAL REALTH PROGRAMME COOLINATIONAL SUBJECT AND REDUCT SUBJECT OF PERSONAL EXPLOSION STRUCTURES.

passes. This beam is generated by a specific lamp, which produces a characteristic spectrum consisting of light specific wavelengths. For each specific metal, a lamp is chosen so that its light spectrum is compatible with the absorption characteristics of the metal.

As the atoms of the specific metal pass through the light, they absorb energy from the light and the intensity of the beam is reduced in proportion to the numbers of atoms present. The reduction in intensity is measured and by comparing this reduction (usually referred to as absorbance) with a calibration curve, a measure of the amount of element present can be obtained.

### 10.2 X-ray diffraction (XRD)

X-ray diffraction is an analytical technique used to identify and quantify the constituent compound in a substance. It works as follows:

- Many solids, and particular minerals, are crystalline (their atoms are arranged in a highly ordered three-dimensional lattice) and when x-rays are directed at them, this lattice acts as a diffraction grating. Every crystalline substance produces a unique diffraction pattern and in a mixture of substances each will produce its own pattern independently of the others. Therefore, different substances can be identified in a mixture.
- The x-ray detector is swung round in an arc and a chart is produced showing lines of all the diffracted x-rays, which are picked up at different angles. The analyst will compare the patterns of the lines produced with standards and will be able to identify what is present in the sample. The more of a particular substance in the sample, the more intense will be the lines in the pattern. A calibrated x-ray diffractor will, therefore, give information not only on the type of crystalline substance in the sample, but how much there is.
- X-ray diffraction only works for crystalline substances and is used particularly for analysing minerals such as quartz (a crystalline form of silica).

ON DIVITIONAL REACTLERINGRAMMIC OCCUPATIONAL OF CITAL AND MEDICAL SURVEILLAWS AT ON PERSONAL EXPOSURE TO SUBJECT OF OUT AND THE POLITICITY.

### 10.3 X-ray fluorescence (XRF)

X-ray fluorescence is another method using x-rays, but it is used to identify and quantify elements rather than compounds. A beam of x-rays is directed at the sample, very much in the same way as XRD, but instead of the compounds in the sample diffracting the beam, the beam excites the atoms of the elements present causing them to emit their own radiation. This is a form of fluorescence. It is this secondary or fluorescent radiation, which is detected. Every element will produce radiation containing a characteristic set of wavelengths so that the trace obtained from a particular sample is compared to standard traces to determine the elements present in the sample. The intensity of the radiation given off is proportional to the amount of each element present, so if the instrument has been calibrated, it is possible to find out not only what elements are present but also how much there is.

XRF can be used to analyse elements from atomic number 9 (fluorine) upwards and is used particularly for metals.

### 10.4 Infra-red (IR)

Infrared can be used as an alternative method to XRD to analyse minerals. Light in the infrared region is directed onto a sample, which absorbs some of the light. A detector picks up the reflected rays of the remainder and a material is then identified and quantified according to how much light has been absorbed and in what regions of the IR spectrum.

No. 41561 157

OCCUPATIONAL FEACTIF PROGRAMME INCODING RIMAL HYGRENE AND MEDICAL FEMILER DORT

ANNEXURE F: Quality assurance (For information purposes only)

### 1. ROLE OF WEIGHING QUALITY ASSURANCE PROGRAM

Analytical data are used to make a variety of decisions, e.g. to decide whether a particular chemical agent is present in a workplace atmosphere, whether a hazard to workers' health exists in that atmosphere, or whether a workroom atmosphere complies with applicable standards. Errors in such data can have a variety of costly effects. The consequences of erroneous data may lead to the wrong decision being made as to whether a non-compliance situation exists. If the analytical results are a part of a larger experiment, perhaps the wrong conclusion might be reached or the results might be uninterpretable. If the presence or absence of a particular agent is erroneously reported, a threat to workers' health may be allowed to continue. It is the role of a weighing facility's quality assurance program to provide the necessary safeguards to minimize these occurrences and to provide a means of detecting errors when they do occur.

It is not possible to design a quality assurance program to fit all weighing facilities since no two weighing facilities serve the exact same purpose or operate in exactly the same manner. Each weighing facility must set its own operating procedures and quality control practices, and document them in a Quality Assurance Manual. This chapter, therefore, will not set forth concrete recommendations for implementing a quality assurance program, but rather will present aspects of weighing facility quality assurance and quality control, which should be addressed by each facility.

A successful quality assurance effort cannot be achieved through the efforts of only one individual. A weighing facility's quality assurance coordinator needs the assistance and cooperation of all facility personnel to be effective. To this end, it is necessary to discourage adversarial relationships between quality control personnel and bench chemists. Analysts must be trained and made aware of the purpose and value of quality assurance functions and, in turn, the quality assurance program must be designed so that its functions are based on sound goals directed toward improving the performance of both the individual analyst and the facility as a whole.

### GOVERNMENT GAZETTE, 6 APRIL 2018

CONPUTED FOR THE REPORT OF DESCRIPTION OF THE PROPERTY OF THE

Frequently, analytical results are challenged months or years after the analysis is complete. In order to support the original data, an effective record-keeping system must be maintained. Another chemist must be able to reconstruct the exact treatment to which the samples were subjected solely from an analytical laboratory's records. Furthermore, if the appropriate quality control checks were performed with the analysis and documented, there can be no doubt regarding the results.

# 2. ORGANISATION

A weighing facility, just as any other organisation, should have a clearly defined organisational structure. Responsibilities of each member of the facility's staff should be in writing and understood by all. In this way, confusion regarding tasks that need to be performed can be avoided.

The specific organisational structure of the facility will vary, depending on the facility's function. Two functions that relate to quality should be assigned in every facility:

- The quality assurance coordinator; and
- The sample clerks.

The size and nature of the facility may preclude assignment of a full-time position to these functions; however, a facility member should be assigned these duties and it should be understood that they are to have top priority.

a) Quality assurance coordinator

The quality assurance coordinator's functions will depend on the size and nature of the facility. This professional has overall responsibility for assuring that reported data meet established standards for precision and accuracy and that these results can be supported scientifically by the various quality control checks performed with the analysis. One of the major functions of this individual is to perform audits of the quality control system and to implement changes that STAATSKOERANT, 6 APRIL 2018

OCULATIONAL MEALTH FROGRAMME, OCCUPATIONAL OVGIENE AND MEDICAL SURVEYLARSE, ON CLASSINGLED FORE TO COMPATIONE POLLOTANTS

eliminate recurring errors. The quality assurance coordinator should not be under the direct supervision of management responsible for day-to-day weighing facility's operation. In this way, conflicts between the facility's dual responsibilities of providing analytical results in a rapid fashion while maintaining quality can be avoided. The quality assurance coordinator should also serve as a resource person for chemists or managers on questions or problems related to quality assurance and should have a working knowledge of statistics, including quality control charting, and experimental design.

b) Sample clerk

The sample clerk's functions will also vary, depending on the size and function of the facility. As a minimum, the sample clerk is responsible for the receipt and log-in of samples. Field samples should be stored in a secure location under proper conditions (temperature, etc.) until analysis. Logging and tracking of samples in the facility is important so that the history of these samples can be documented and processed in a timely manner. The sample clerk may also be given the responsibility of maintaining chain of custody documentation.

# 3. QUALITY ASSURANCE IN SAMPLING

Quality assurance procedures should not be overlooked by personnel performing field sampling. The field sampling parameters often have more effect on precision and accuracy of the final result than parameters of the measurement. Field personnel should become familiar with sampling and measurement methods that they will use. The methods usually specify the proper sampling media to be used, the correct flow rate and sample volume, as well as special precautions on sample handling, shipping and possible interferences.

Sampling equipment must be maintained in reliable working order. It is desirable to have one person or group given responsibility for the care, maintenance and stocking of field sampling equipment. This person or group should periodically inspect and repair all equipment and keep track of the use and location of sampling equipment when it is signed out. Sampling pumps should be calibrated with each use. This

### GOVERNMENT GAZETTE, 6 APRIL 2018

OCCUPATIONAL HEALTH PROGRAMME COCCUPATIONAL HYDRENE AND REDICAL SURVEILLABLES ON PERSONAL EXPOSURE TO ARREMITE POLICYAMIS

calibration should be performed with the sampler in line. Since differences in pressure drop across the sampler will affect flow rate, it is necessary to perform the calibration with the actual sampler to be used.

The exact sampling time must be known in order to accurately estimate the sampled volume. Recording only the start and stop time assumes that the pump functions properly over the entire sampling period. Occasional spot checks for proper operation should be made throughout the sampling period.

Since many modern analytical techniques are extremely sensitive, special care must be taken to avoid contamination of field samples. Samples must not be stored or shipped with bulk materials that might spill or otherwise present the possibility for contamination. The glassware or other containers used in sampling and shipping should be subjected to any cleaning procedures recommended in the analytical method.

Careful record keeping in the field is also important. Pertinent information such as temperature, humidity, possible interfering compounds, sampling location, etc. should be documented. Special care should be taken in sample labelling and in preparation of paperwork accompanying the samples so that confusion in the facility is avoided.

Field blanks are used to estimate contamination that may occur immediately before and after sampling, during shipment, or while awaiting measurement in the facility. The nature and number of blanks taken will depend on the method and sampling situation; therefore, field sampling personnel must attempt to determine what sources of contamination are possible in the specific situation at hand. The field blank strategy must then be designed accordingly. Where possible, a written sample protocol should be developed before actual sampling begins. The protocol should contain a description of the environment being sampled; the assumptions made in derivation of the model of that environment; when, where, and how the sampling will be done; and how many samples will be taken. Samplers should be identified by batch or lot number of sampling media. OCCUPATIONAL VEALTH FROGRAMME ROCCOPATIONAL RYGIENE AND MEDICID. PURVED RANCH ON INFROMACER POST TO ARREST TO ARREST.

# 4. QUALITY ASSURANCE IN MEASUREMENT

Certain quality control checks should be performed with each sample set to further support the reported results on actual field samples. The exact number and nature of these checks depend on the specific method and circumstances under consideration and should be thought of as an integral part of the method itself (i.e. a measurement should not be considered completed without the quality control checks also being completed). Each analyst must take an independent responsibility for assuring that the analytical quality control system works. This can be accomplished by using known spiked samples that closely simulate field samples with regard to concentration and interferences. Since the analyst is most familiar with the methods being used and should know what range of recoveries to expect, problems with the system can be detected early. The following additional quality control checks should be considered as appropriate:

### a) Methods

First, and perhaps most important in the area of quality control, a laboratory must have adequate measurement procedures. These methods should be written so that there is no doubt in the analyst's mind of the exact steps which must be performed and so that future references to the work can be as exact as possible. The methods used should be evaluated, where possible (either by the laboratory itself or by some other organisation), to verify that the methods perform satisfactorily. Factors that could be evaluated include the recovery of the analyte of interest from both spiked samples and generated samples, the stability of collected samples or possible interferences for accurate use of the method. Methods should be tested for ruggedness so that critical steps in the analysis can be identified. Experimental designs have been published which permit rapid evaluation of a number of factors involved in the analysis.

### b) Standards

Standard solutions may be for either identification or quantitation of the analyte of interest. The bulk material used for preparation of standards should be of

### GOVERNMENT GAZETTE, 6 APRIL 2018

#### O SCIERAD DNAL NEALTH HROGRAMME COCCUPATIONAL HYDENE AND MEDICAL SUP VEH CARRY IN ON PERSONAL EXPOSURE YO ARROPINE POLICITIANTS

sufficient purity to avoid errors in the identification or quantitation. Where available, Standard Reference Materials or other well-characterized standards are useful for assuring that results are consistent with other organisations and agencies. Laboratory reagents and standards should also be properly labelled with contents, and receipt and expiration dates.

For quantitation, sufficient numbers of standards should be prepared so that adequate confidence intervals on reported values can be obtained. As a guideline, it is recommended that calibration curves be prepared with triplicate points at each of at least five different concentration levels. The standard curve should be prepared so that linearity can be assured over the range of the curve. Also, it is important that the concentration of standard solutions be chosen to bracket the actual samples. In this way, extrapolation outside the range of standards is avoided. The concentration of standard solutions should be chosen to be consistent with the purpose of the sampling. That is, if it is desired to demonstrate whether exposure standards are being met, then the standard curve should be constructed to bracket the concentrations which would be encountered at or near the applicable exposure standard. If it is desired to demonstrate whether a compound is present in the atmosphere being sampled, then the calibration curve should be constructed closer to the limit of detection. During measurement, working standards should be interspersed with field samples. In this way, it should be possible to detect if instrument drift becomes significant. Internal standards are useful for correcting instrument response for the actual amount of sample injected into a chromatograph. The internal standard should be chosen so that its retention time is reasonably close, without peak overlap, to the peak of interest.

### c) Blanks

A particular analysis may involve several types of "blank" measurements including reagent blanks, media blanks or field blanks. Reagent blanks measure the signal contribution from solvents, acids or other reagents used by the laboratory in preparing samples for analysis. Media blanks measure the signal contribution from the collection media (impinger solution, filter, sorbent

STAATSKOERANT, 6 APRIL 2018

CLEPATIONAL REACTH REGISTRAMME COCCUPATIONAL REGISTER AND REDUCTO SUBVEICENCE. ON PERSONAL EXPOSIBLE TO ARROWNE POLICITIAN S

tube, etc.) and field blanks measure signal contribution of the media plus any contamination that may have occurred during handling, shipping and storage before analysis. The nature and number of blank measurements will depend on the method and circumstances, but the purpose of all blank measurements is to help prevent errors in identification and quantitation of field samples.

d) Blind samples

Blind samples are prepared by someone other than the analyst performing the measurement and are to provide an independent check on the accuracy and precision of the measurement.

If blind samples cannot be prepared with confidence, their use should be avoided. In these cases, confusion may result when discrepancies occur and it will not be possible to say for certain whether the measurement or the blind sample was in error.

The results should be used in conjunction with control charting techniques to identify errors or malfunctions in the system. To accomplish this goal, quality assurance personnel should work closely with laboratory personnel to quickly identify and eliminate trouble spots.

It will not always be possible to isolate the source of error in the results of a blind sample. In these instances, it should be recognized that it will not be possible to defend quantitative results for that particular sample set; therefore, reporting of results where these discrepancies occur should be avoided.

e) Recovery studies

Recovery studies should be performed as a part of the measurement whenever the analyte of interest must be liberated or separated from the sampling media. The analyte of interest should be added to the media at levels consistent with the field samples. These "spiked" samples should then be treated in the same manner as the field samples. Corrections for recovery should be made

115

### GOVERNMENT GAZETTE, 6 APRIL 2018

CALIFATIONAL REALTH PROGRAMME COCUPATIONAL SUBJECT AND VEEKCH, SURVERTINGLE) DR REPSOND, EXPOSORE TO SUREDNIE POLICIANTS

whenever the measured recovery is significantly different from 100%. Even if recovery has historically been 100%, recovery studies can be useful as additional analytical and calculation checks. It is often helpful for a laboratory to maintain a record of past recovery studies so that current data may be compared for discrepancies. Samples for which estimated recovery is less than 75% should be reported as "semi quantitative".

# f) Duplicates

Duplicate preparations of bulk materials are useful as an indication of the uniformity of the bulk material. Duplicate injections or measurements from air samples are of lesser importance since preparations from air samples are generally fairly uniform in nature. True duplicates of air samples are useful as an indication of the uniformity of the atmosphere being sampled.

# 5. INTER-LABORATORY TESTING

Assignable analytical uncertainty can be considered as consisting of interlaboratory and intra-laboratory variability. Knowledge of the magnitude of these two sources of variability is essential in order to interpret and use analytical data property. Intralaboratory variability can be estimated from the results of analysis of blind samples. Interlaboratory testing requires the cooperation and coordination of a number of independent laboratories.

Interlaboratory testing can also be useful for defining the relationship of data reported by different laboratories using either the same or different measurement techniques. Participation in such studies can be useful for uncovering errors in methodology or identifying critical steps in the procedures.

The Proficiency Analytical Testing (PAT) Program operated by the American Industrial Hygiene Association (AIHA) in cooperation with NIOSH is useful for measuring a laboratory's performance on a variety of common occupational hygiene samples, including solvent vapours on charcoal tubes and metals, asbestos and COUPATIONAL HUR ETHICK ASSAUNT TO CLARATIONAL RYLIPPIC AND METHICAL SUBJECT AND THE PROVALE PROSTRE TO DEPENDE POLICIES TO DEPENDENT.

silica on filters. Participation in this program by laboratories performing occupational hygiene analysis is strongly encouraged.

Similarly, the AIHA operates a laboratory accreditation program for occupational hygiene laboratories. Site visits and application reviews can provide a useful review of a laboratory's overall quality assurance system, as well as the adequacy of personnel, facilities and equipment.

# 6. **REPORTING**

The detail and nature of the analytical report will depend on the function of the laboratory. As a minimum, the report should include a description or reference to the method used, any deviations or special circumstances encountered with the sample set, estimates of the limits of detection and quantitation, the date of analysis, as well as the results themselves. The report should be signed by the analyst and at least one other person who is responsible for approving the report. The laboratory should adopt a standard report format and attempt to maintain that format with all reports.

The limit of detection (LOD) is defined as the amount of the analyte that can be distinguished from the background. The limit of quantitation is that amount of analyte above which the precision of the reported results is better than a specified level. There are numerous methods of determining these quantities and many opinions as to which method is correct. The laboratory should decide on a method for determining these quantities and be consistent to the extent possible in its use.

Sample data should be corrected for recovery or desorption efficiency and for reagent and media blank response. However, field blanks should be treated like field samples (corrected for reagent blanks, media blanks, and recovery). If correction for contamination in the field blanks is necessary, this correction should be performed by the person who submitted the sample.

Data should be reported simply and concisely and in a manner, that "their meaning is not distorted by the reporting process. Attention should be given to the number of

OCCUT ATTOMAT HEALTH PROGRAMME INCLUSIVE TIONAL HYCLEVE MUDILIEDY AL SUBVETI LATORE ON FEDEROVAL ESSA ISLINE TO ARROFILE POLLUTINES

significant figures reported. Generally, only the last figure reported should be in doubt.

# 7. LABORATORY NOTEBOOKS

Laboratory notebooks are used for recording all experimental and analytical notes and data. New notebooks should be logged out to a chemist. The notebook remains the property of the laboratory and should be kept in a central location by the laboratory after it is filled.

Notebooks used in the laboratory should be hard-covered and bound. Use of notebooks with removable pages (e.g. loose-leaf notebooks) should be discouraged. The pages of the notebook should be numbered and any entries made by an individual other than that to whom the book was assigned should be noted. Some laboratories require that the individual's notebook pages be signed by the chemist for legal reasons.

The notebook should contain all information gathered by the chemist pertaining to the sample. Where appropriate, lab number, field number, sequence number and other identifying numbers are noted. Measurements requested, identification of the method, modifications to the method and the sample originator should be included. A description of the sample (whether bulk material, charcoal tube, etc.) should be included. Data on quality assurance aspects of the sample set such as blank values, recovery studies and duplicate determinations should also be included. Formula used to calculate results and a sample calculation should be shown.

If permanent retention of computer printouts, recorder charts or similar items is deemed necessary, they should be pasted, taped or stapled in the notebook, if practical.

The minimum data entered in the notebook should be sufficient to enable another chemist to derive the same results as the original worker, with no other source of information. In addition to this minimum data, any other facts appropriate and pertinent to the sample analysis are to be entered.

STAATSKOERANT, 6 APRIL 2018

No. 41561 167

2001PATENAL INCALING PROCRAMME LOCICIDADIONAL INCIGENE AND REDICAL DIRVERTATION OF TAXABLE EXPLORED AND ARBORNE FOLLOTAITS

A chemist's notebook is always subject to inspection by his colleagues, supervisors or inspectors from outside the laboratory. Therefore, it is imperative that the notebook be maintained in a professional manner and contains all pertinent information that may be required by other parties, regardless of the particular importance of that information to the chemist. Furthermore, the notebook must be maintained in such a manner that it can withstand challenges as to the validity, accuracy or legibility of its contents.

### 8. INSTRUMENT MAINTENANCE

Laboratory instrumentation must be maintained in proper operating condition. It has been found in numerous cases that the cause for out-of-control quality control samples has been traced to faulty instrument performance. In many of these instances, the operator was unaware that instrument performance had degraded. Performance checks can be useful in documenting instrument performance over time and in detecting deviations. To be of use, performance check procedures should be quick and easy to perform. Where appropriate periodic calibration should be performed and documented (e.g. balances, microscopes). Records of calibration should be recorded in the logbook for that instrument.

An instrument's maintenance history is often valuable in troubleshooting problems with that instrument. The record of instrument maintenance should be maintained in an "instrument logbook" and kept near that instrument or in a recognized location.

Service contracts or maintenance agreements for instrument repair are useful for assuring that instrumentation is serviced by qualified personnel and maintained in proper operating condition.

# 9. SAMPLE TRACKING

A laboratory should have a mechanism for logging and tracking samples after they are received in the laboratory so that all samples can be processed in the most efficient manner. The exact system used for sample tracking will depend on the size

#### GOVERNMENT GAZETTE, 6 APRIL 2018

COUNDRATIONAL TRACTO TROUCT A MAR DOCUMPNITIONAL MYSTERS AND IMERCAL SUPPORT IN A CONTRACT OF A DRIVEN OF A DRIVEN

and nature of the laboratory and may range from hand-entry logbooks to sophisticated computer-based systems. The system should include a means of cross-referencing laboratory sample numbers with field sample numbers and it should be possible to determine the chemist, instrument, and other aspects of the sample set from the field number.

Sample tracking systems may also be used to produce management statistics which may aid in forecasting future sample loads or point to problem areas in sample turnaround.

# 10. QUALITY ASSURANCE RECORDS

Maintenance of quality assurance records aids in recalling details of a particular analysis at a future date. A condensation of quality assurance data can be used as supporting evidence to field personnel should the need arise. Quality assurance records can also be used to track various quality assurance parameters over time (such as desorption efficiency or blank values).

Computerised record keeping systems should be backed up periodically. Archive copies of computer data require specialized storage conditions and these archive copies may not be reliable for extended periods of time.

Filing of records should be current and accurate. If rapid retrieval of data is not possible, then maintenance of quality assurance records loses its purpose. The primary purpose is to provide a system to furnish information rapidly regarding the status of specific sample sets.
